SERINE PROTEASE INHIBITOR

The invention relates to a serine protease inhibitor comprising an ether bonded arginine replacement, a pharmaceutical composition containing the same, as well as the use of said serine protease inhibitor for the manufacture of a medicament

Serine proteases are enzymes which play an important role in the blood coagulation cascade. Apart from thrombin and factor Xa, other examples of this group of proteases comprise the factors VIIa, IXa, XIa, XIIa, and protein C. Thrombin is the final serine protease enzyme in the coagulation cascade. The prime function of thrombin is the cleavage of fibrinogen to generate fibrin monomers, which are cross-linked to form an insoluble gel. In addition, thrombin regulates its own production by activation of factors V and VII earlier in the cascade. It also has important actions at cellular level, where it acts on specific receptors to cause platelet aggregation, endothelial cell activation and fibroblast proliferation. Thus thrombin has a central regulatory role in haemostasis and thrombus formation. Since inhibitors of thrombin may have a wide range of therapeutic applications, there is a continuous effort to find new serine protease inhibitors. The difficulty in this endeavour is to find a compound in which the properties of therapeutic safety, selectivity, potency and synthetic accessibility are combined. In particular the bioavailability with the oral route of administration can be problematic for selective thrombin inhibitors. In WO 97/16444 thrombin inhibitors are described with modifications of the tripeptide sequence phenylalanyl-prolyl-arginine, in which a carboxyl group is present at the amino terminal and arginine is replaced by a basic (aminoiminomethyl)phenyl or a basic (aminoiminomethyl)pyridinyl group linked to a prolyl analogue by an ether bond.

It is the object of this invention to provide new chemically accessible serine protease inhibitors with a favourable pharmacological and toxicological profile with sufficient potency for therapeutic use.

It has been found that this object can be met with a serine protease inhibitor, and in particular a thrombin inhibitor, having the formula (I),

Since the amino-group in aminoisoquinoline, aminoquinazoline or aminophthalazine is having less basicity than amino groups in lysine and arginine, it is unexpected that the newly invented compounds have sufficient efficacy for serine protease inhibition.

As mentioned, amongst the compounds of the present invention are inhibitors of serine proteases involved in the blood coagulation cascade, and in particular inhibitors of thrombin and/or factor Xa. These compounds can be used in medical and veterinary therapy, i.e. for treating and preventing thrombin-mediated and thrombin-associated diseases. This includes a number of thrombotic and prothrombotic states in which the coagulation cascade is activated. Such diseases and states are or occur with, for example, deep vein thrombosis, pulmonary embolism, thrombophlebitis, arterial

5

occlusion from thrombosis or embolism, arterial reocclusion during or after angioplasty or thrombolysis, restenosis following arterial injury or invasive cardiologic procedures, postoperative venous thrombosis or embolism, acute or chronic atherosclerosis, stroke, myocardial infarction, certain types of cancer and metastasis, and certain types of neurodegenerative diseases. Compounds of the invention may also be used as *in vitro* anticoagulants or as anticoagulants in extracorporeal blood circuits, such as those necessary in dialysis and surgery.

According to a further aspect, the present invention provides a method of treating and/or preventing thrombin-mediated and thrombin-associated diseases in an animal or human, which comprises treating said animal or human with a therapeutically effective amount of a compound according to this invention.

The compounds of the invention may be administered enterally (e.g. orally, rectal nasal or topically) or parenterally (e.g. via intramuscular, subcutaneous, intravenous or intraperitoneal injections).

The exact dose and regimen of these compounds and compositions thereof will necessarily depend on the needs of the individual subject to whom a compound of this invention is being administered in the form of a medicament and on the degree of affliction or need and the judgment of the medical practitioner. In general, parenteral administration requires lower dosages than other methods of administration which are more dependent upon absorption. However, the daily dosages are for humans preferably 0.001–100 mg per kg body weight, more preferably 0.01–10 mg per kg body weight.

A daily dose can be administered in one or more dosage units suitable for example for the oral, the rectal, the sublingual or the nasal route or through the skin (for example, transdermal patches, or in the form of a cream).

Another route of administration of a compound of this invention is the introduction thereof into a (dialysis) circuit by other means, e.g. by injecting it either gradually or at once into the system upstream of the dialysis membrane simultaneously with the introduction of the blood into the circuit. Moreover, the lines and/or further equipment of the extracorporeal circuit can be furnished with a compound of this invention, preferably by way of a coating (but not limited to this). Alternatively, a compound of this invention may be adsorbed in the materials of parts of the equipment, e.g. in the membranes used for dialysis.

The invention includes a pharmaceutical composition for inhibiting loss of blood platelet aggregates, inhibiting formation of fibrin, inhibiting thrombus formation, and inhibiting embolus formation in a mammal, comprising a compound of the invention with suitable auxiliaries. These compositions may optionally include anticoagulants, antiplatelet agents, and thrombolytic agents. The pharmaceutical compositions can be added to blood, blood products, or mammalian organs in order to effect the desired inhibitions. The invention also includes a pharmaceutical composition for preventing or treating unstable angina, refractory angina, myocardial infarction, transient ischemic attacks, atrial fibrillation, thrombotic stroke, embolic stroke, deep vein thrombosis, disseminated intravascular coagulation, and reocclusion or restenosis of recanalized vessels, in a mammal, comprising a compound of the invention in a pharmaceutical composition. These pharmaceutical compositions may optionally include anticoagulants, antiplatelet agents, and thrombolytic agents. The invention also includes a method for reducing the thrombogenicity of a surface in a mammal by attaching to the surface, either covalently or noncovalently, a compound of the invention.

6

The invention further includes a pharmaceutical composition, as hereinbefore described, in combination with packaging material suitable for said composition, said packaging material including instructions for the use of the composition as hereinbefore described.

For making means of dosing, such as pills, tablets, suppositories, (micro-)capsules, powders, emulsions, creams, ointments, implants, sprays, injection preparations in the form of a solution or suspension, suitable auxiliaries such as carriers, fillers, binders, lubricants, dispersants, emulsifiers, stabilizers, surfactants, anti-oxidants, colorants, preservatives and the like can be used e.g. as described in the standard reference, Gennaro et al., Remington's Pharmaceutical Sciences, (18th ed., Mack Publishing Company, 1990, see especially Part 8: Pharmaceutical Preparations and Their Manufacture). In general any pharmaceutically acceptable auxiliary which does not interfere with the function of the active compounds is suitable and can be used.

Suitable carriers and fillers with which the active agent of the invention can be administered include for example, agar, alcohol, cellulose derivatives, fats, polysaccharides, polyvinylpyrrolidone, silica, sterile saline, and the like.

Binders are agents used to impart cohesive properties to a pharmaceutical composition resulting in minimal loss from the pharmaceutical composition during production and handling. Binders are for example cellulose, starches, polyvinylpyrrolidone, and the like.

A suitable lubricant with which the active agent of the invention can be administered is, for example, magnesium stearate.

Surfactants are agents facilitating the contact and migration of compounds in different physical environments such as hydrophilic and hydrophobic environments. Many surfactants are known in the art of making pharmaceutical compositions as for example described in chapter 19 of Remington's Pharmaceutical Sciences (18th edition Editor A. R. Gennaro; Mack Publishing Comp; Easton, Pa.). Surfactants that can be used during the process of preparing the pharmaceutical formulation are, for example, polyethylene glycol (PEG), and the like.

The compounds may also be used with implantable pharmaceutical devices such as those described in U.S. Pat. No. 4,767,628, the contents of which are incorporated by this reference. Then the device will contain sufficient amounts of compound to slowly release the compound (e.g. for more than a month).

Compounds of formula (I) may be prepared from a compound of formula (II), or derivatives thereof wherein the amino group at the aromatic group (arylamino) is protected as urethane such as Alloc or amide such as benzoyl, wherein W, E, X, Y and m have the previously defined meaning and Pg is an N-protecting group (preferably urethane such as Boc).

(II)

The term N-protecting group as used in this document means a group commonly used in peptide chemistry for the protection of an α -amino group, like the allyloxycarbonyl (Alloc) group, the tert-butyloxycarbonyl (Boc) group, the benzyloxycarbonyl (Z) group, the

7

9-fluorenylmethoxycarbonyl (Fmoc) group or the phthaloyl (Phth) group. Removal of the protecting groups can take place in different ways, depending on the nature of those protecting groups. An overview of amino protecting groups and methods for their removal is given in the above mentioned The Peptides, Analysis, Synthesis, Biology, Vol 3. and in T. W. Greene and P. G. M. Wuts, Protective Groups in Organic Synthesis, 2nd edition, 1991, John Wiley & Sons, Inc. .

Removal of the N-protecting group Pg and optional modification(s) of the deprotected amine group using methods known in the field such as peptide coupling, alkylation or reductive amination give compounds of formula (I). Compounds of formula (II) can be prepared from a compound of formula (III), or derivatives thereof wherein the arylamino is protected as urethane such as Alloc or amide such as benzoyl, wherein E, X, Y, m and Pg have the previously defined meanings. Removal of the N-protecting group Pg in compounds of formula (III) and peptide coupling with compounds of formula Pg-w-OH, in which W and Pg have the previously defined meaning, yields compounds of formula (II).

Alternatively, compounds of formula (I) can be prepared directly from compounds of formula (III). Removal of the N-protecting group Pg in compounds of formula (III) and a peptide coupling with a compounds of formula J-W-OH, in which J and W have the previously defined meanings and may optionally contain an additional protecting group, afford compounds of formula (I). Compounds of formulas (I), (II) and (III) are accessible from those of formula (IV) wherein X and Y have the previously defined meanings, or derivatives thereof wherein the arylamino is protected as urethane such as Alloc or amide such as benzoyl, by reaction with alcohols of formula J-W-E-(CH₂)_m-OH, Pg-W-E-(CH₂)_m-OH or Pg-E-(CH₂)_m-OH, in which W, E, J, m and Pg have the previously defined meanings and optionally containing a protecting group, under standard Mitsunobu conditions (tributylphosphine, dialkyl azodicarboxylate) (R. L. Elliot, H. Kopecka, D. E. Gunn, H.-N. Lin and D. S. Garvey, *Biorgs. Med. Chem. Lett.*, 6, 2283 (1996); K. Wisniewski, A. S. Koldziejczyk and B. Falkiewicz, *J. Pept. Sc.*, 4, 1 (1998)).

Alcohols of type formula Pg-E-(CH₂)_m-OH in which E=R³NCH₂- and m=2 are accessible by conjugate addition of the corresponding amine R³NH₂ to ethyl acrylate, reduction of the ester function with lithium aluminium hydride, and subsequent introduction of the N-protecting group Pg.

8

Demethylation of methyl aryl ethers of formula (V) to the corresponding phenolic compounds of formula (IV) may be accomplished by reaction with BBr₃ [J. F. W. McOmie and D. E. West, *Org. Synth., Collect. Vol. V*, 412 (1973)] or EtSNa [A. S. Kende and J. P. Rizzi, *Tetrahedron Lett.*, 22, 1779 (1981)].

Suitable starting material to prepare compounds of formula (V) are compounds of formula (VI) wherein X and Y have the previously defined meanings. The chloro group of compounds of formula (VI) can be transformed directly into an amine group by heating the former with ammonia under pressure. Alternatively, the chloro group of compounds of formula (VI) can be converted into a phenoxy group by reaction with phenol under alkaline conditions, and subsequently treatment with ammonium acetate affords the amine group of compounds of formula (V). Compounds of formula (V) can also be obtained by treatment of compounds of formula (VI) with sodium azide and subsequent reduction of the aryl azide with PPh₃.

Compounds of formula (VI) wherein X and Y have the previously defined meanings can be obtained from compounds of formula (VII) by treatment with phosphoryl chloride. Compounds of formula (VII) are described in literature; 7-methoxy-3H-quinazolin-4-one: Chapman et al., *J. Chem. Soc.* 890 (1947), 6-methoxy-2H-phthalazin-1-one: Consonni P. and A. Omodei-Sale, *Farmaco, Ed.Sci.* 76, 691 (1976) (Chem. Abstr. 85-177191). The compound of formula (VI) wherein X=CH and Y=CH (1-chloro-6-methoxy-isoquinoline) can be prepared by converting 6-methoxy-isoquinoline (Hendrickson, J. B.; Rodriguez, C.; *J. Org. Chem.* 1983, 48, 3344-3346) into the N-oxide salt, e.g. with a peracid, such as m-chloroperbenzoic acid, followed by HCl treatment, and subsequently reacting this N-oxide salt with a chlorinating reagent, like phosphoryl chloride (J. Robinson, *J. Am. Chem. Soc.*, 69, 1941 (1939)).

The peptide coupling, as mentioned as a procedural step in the above described method to prepare the compounds of the invention, can be carried out by methods commonly

known in the art for the coupling—or condensation—of peptide fragments such as by the azide method, mixed anhydride method, activated ester method, or, preferably, by the carbodiimide method, especially with the addition of catalytic and racemisation suppressing compounds like N-hydroxysuccinimide and N-hydroxybenzotriazole. Suitable methods are described in: *The Peptides, Analysis, Synthesis, Biology*, Vol 3, E. Gross and J. Meienhofer, eds. (Academic Press, New York, 1981), R. Knorr, A. Trzeciak, W. Bannwarth and D. Gillissen, *Tetrahedron Lett.*, 30, 1927 (1989) and L. A. Carpino, *J. Am. Chem. Soc.*, 115, 4397 (1993).

The compounds of the invention, which can be in the form of a free base, may be isolated from the reaction mixture in the form of a pharmaceutically acceptable salt. The pharmaceutically acceptable salts may also be obtained by treating the free base of formula I with an organic or inorganic acid such as hydrogen chloride, hydrogen bromide, hydrogen iodide, sulfuric acid, phosphoric acid, acetic acid, propionic acid, glycolic acid, maleic acid, malonic acid, methanesulphonic acid, fumaric acid, succinic acid, tartaric acid, citric acid, benzoic acid, and ascorbic acid.

The compounds of this invention possess one or more chiral carbon atoms, and may therefore be obtained as a pure enantiomer, or as a mixture of enantiomers, or as a mixture containing diastereomers. Methods for obtaining the pure enantiomers are well known in the art, e.g. crystallization of salts which are obtained from optically active acids and the racemic mixture, or chromatography using chiral columns. For diastereomers straight phase or reversed phase columns may be used.

The invention is illustrated by the following examples.

(2S)-1-(N(-)-camphorsulphonyl-D-cyclohexylalaninyl)-2-(2-(1-amino-isoquinolin-6-oxy)-ethyl)-piperidine

1a. 6-Methoxy-isoquinoline-N-oxide hydrochloride

At room temperature 133 g of m-chloroperbenzoic acid (purity 75%) was added in portions to a stirred solution of 6-methoxy-isoquinoline [Hendrickson, J. B.; Rodriguez, C.; *J. Org. Chem.* 1983, 48, 3344–3346; 79.8 g; 500 mmol] in 1.2 L of dichloromethane. Stirring was continued for 3 hours and subsequently methanol (1 L) was added. The bulk was reduced to 700 mL after which 800 mL of a saturated solution of hydrogen chloride in diethyl ether was added. Dilution with 1.5 L of diethyl ether resulted in precipitation of yellow crystals, which were separated by filtration, washed with chilled diethyl ether and dried in vacuo. Yield: 85 g (80%); white solid; m.p. 189–191° C.; (+)-FAB-MS: 176 (MH⁺-HCl).

1b. 1-Chloro-6-methoxy-isoquinoline

6-Methoxy-isoquinoline-N-oxide hydrochloride (1a, 85 g; 400 mmol) was carefully added in portions to phosphoryl

chloride (550 mL) at a temperature of 90° C., after which the mixture was stirred for 6 h at 90° C. Excess of phosphoryl chloride was removed in vacuo. The remaining white solid was washed with water, filtered and dried in vacuo. Yield: 68 g (88%); white solid; m.p. 72–74° C.; EI-MS: 193 (M⁺).

1c. 6-Methoxy-11-phenoxy-isoquinoline

To a mixture of 1-chloro-6-methoxy-isoquinoline (1b, 16.8 g, 87 mmol) and phenol (67 g) was added powdered potassium hydroxide (8.4 g). The mixture was heated under a nitrogen atmosphere to 140° C. for 3 h, allowed to cool to room temperature and subsequently diluted with 280 mL of 3 N sodium hydroxide solution and 500 mL of dichloromethane. The organic layer was washed with 2 N sodium hydroxide, water and brine, dried over magnesium sulphate and concentrated under reduced pressure, yielding 21.3 g (98%) of a white solid. ESI-MS: 251.8 (M+H)⁺. Rf (silica gel; toluene/ethanol, 8/2, v/v): 0.75.

1d. 1-Amino-6-methoxy-isoquinoline

A mixture of 6-methoxy-1-phenoxy-isoquinoline (1c, 21.3 g, 85 mmol) and ammonium acetate (55 g) was heated, under a nitrogen atmosphere, to 150° C. and stirred overnight. The mixture was allowed to cool to room temperature, after which 3 N sodium hydroxide solution (280 mL) was added under stirring. The thus obtained solution was extracted with ethyl acetate (2×300 mL) and the combined organic layers were extracted with 2 N hydrochloric acid (100 mL), containing brine. Subsequently, the pH of the aqueous layer was adjusted to 12 with 2 N sodium hydroxide solution. Extraction with ethyl acetate (300 mL) then afforded an organic layer, which was washed with brine (100 mL), dried (magnesium sulphate) and concentrated under reduced pressure, furnishing 11 g of a white solid (75%). ESI-MS: 175.2 (M+H)⁺, 349.2 (M+2H)²⁺. Rf (silica gel; toluene/ethanol, 8/2, v/v): 0.17.

After stirring for 4 d at ambient temperature the reaction mixture was poured into ice and the pH was adjusted to 9 by adding concentrated aqueous ammonia. The precipitated material was collected by filtration and dried in vacuo to give 8.9 g (88%) of the title compound as a white solid; m.p. 258–260° C.; EI-MS: 160 (M⁺). ¹H NMR (DMSO-d₆): δ 8.11 (d, 1H), 7.65 (d, 1H), 6.99 (dd, 1H), 6.86 (d, 1H), 6.80–6.63 (m, 4H), 5.2 (bs, 1H).

Example 15

The biological activities of the compounds of the present invention were determined by the following test method.

15 Anti-thrombin Assay

Thrombin (Factor IIa) is a factor in the coagulation cascade. The anti-thrombin activity of compounds of the present invention was assessed by measuring spectrophotometrically the rate of hydrolysis of the chromogenic substrate s-2238 exerted by thrombin. This assay for anti-thrombin activity in a buffer system was used to assess the IC₅₀-value of a test compound.

Test medium: Tromethamine-NaCl-polyethylene glycol 6000 (TNP) buffer

Reference compound: 12581 (Kabi)

Vehicle: TNP buffer. Solubilisation can be assisted with dimethylsulphoxide, methanol, ethanol, acetonitrile or tert-butyl alcohol which are without adverse effects in concentrations up to 2.5% in the final reaction mixture.

Technique Reagents*

1. Tromethamine-NaCl (TN) buffer Composition of the buffer:

Tromethamine (Tris)	6.057 g (50 mmol)
NaCl	5.844 g (100 mmol)
Water to	1 l

The pH of the solution is adjusted to 7.4 at 37° C. with HCl (10 mmol.l⁻¹).

2. TNP buffer Polyethylene glycol 6000 is dissolved in TN buffer to give a concentration of 3 g.l⁻¹.

3. S-2238 solution One vial S-2238 (25 mg; Kabi Diagnostica, Sweden) is dissolved in 20 ml TN buffer to give a concentration of 1.25 mg.ml⁻¹ (2 mmol.l⁻¹).

4. Thrombin solution Human thrombin (16 000 nKat.vial⁻¹; Centraal Laboratorium voor Bloedtransfusie, Amsterdam, The Netherlands) is dissolved in TNP buffer to give a stock solution of 835 nKat.ml⁻¹. Immediately before use this solution is diluted with TNP buffer to give a concentration of 3.34 nKat.ml⁻¹.

All ingredients used are of analytical grade

For aqueous solutions ultrapure water (Milli-Q quality) is used.

Preparation of test and reference compound solutions

The test and reference compounds are dissolved in Milli-Q water to give stock concentrations of 10⁻² mol.l⁻¹. Each concentration is stepwise diluted with the vehicle to give concentrations of 10⁻³, 10⁻⁴ and 10⁻⁵ mol.l⁻¹. The dilutions, including the stock solution, are used in the assay (final concentrations in the reaction mixture: 3·10⁻³; 10⁻³; 3·10⁻⁴; 10⁻⁴; 3·10⁻⁵; 10⁻⁵; 3·10⁻⁶ and 10⁻⁶ mol.l⁻¹, respectively).

Procedure

At room temperature 0.075 ml and 0.025 ml test compound or reference compound solutions or vehicle are

25

alternately pipetted into the wells of a microtiter plate and these solutions are diluted with 0.115 ml and 0.0165 ml TNP buffer, respectively. An aliquot of 0.030 ml S-2238 solution is added to each well and the plate is pre-heated and pre-incubated with shaking in an incubator (Amersham) for 10 min. at 37° C. Following pre-incubation the hydrolysis of S-2238 is started by addition of 0.030 ml thrombin solution to each well. The plate is incubated (with shaking for 30 s) at 37° C. Starting after 1 min of incubation, the absorbance of each sample at 405 nm is measured every 2 min. for a period of 90 min. using a kinetic microtiter plate reader (Twinreader plus, Flow Laboratories). All data are collected in an IBM personal computer using LOTUS-MEASURE. For each compound concentration (expressed in mol.l⁻¹ reaction mixture) and for the blank the absorbance is plotted versus the reaction time in min.

Evaluation of responses: For each final concentration the maximum absorbance was calculated from the assay plot. The IC₅₀-value (final concentration, expressed in μmol.l⁻¹, causing 50% inhibition of the maximum absorbance of the blank) was calculated using the logit transformation analysis according to Hafner et al. (Arzneim.-Forsch./Drug Res. 1977; 27(II): 1871-3).

Antithrombin activity:

Example	IC ₅₀ (μmol · l ⁻¹)
1	0.41
8	0.61
9	0.32
10	1.35
11	0.5
