## **PRIORITY TO RELATED APPLICATIONS**

**[0001]** This application is a continuation of U.S. application Ser. No. 11/360,085, filed Feb. 23, 2006, now pending; which claims the benefit of European Application No. 05101701.0, filed Mar. 4, 2005. The entire contents of the above-identified applications are hereby incorporated by reference.

## **BACKGROUND OF THE INVENTION**

**[0002]** In the central nervous system (CNS) the transmission of stimuli takes place by the interaction of a neurotransmitter, which is sent out by a neuron, with a neuroreceptor. Glutamate is the major excitatory neurotransmitter in the brain and plays a unique role in a variety of central nervous system (CNS) functions. The glutamate-dependent stimulus receptors are divided into two main groups. The first main group, namely the ionotropic receptors, forms ligand-controlled ion channels. The metabotropic glutamate receptors (mGluR) belong to the second main group and, furthermore, belong to the family of G-protein coupled receptors.

**[0003]** At present, eight different members of these mGluR family are known and of these some even have sub-types. According to their sequence homology, signal transduction mechanisms and agonist selectivity, these eight receptors can be sub-divided into three sub-groups: mGluR1 and mGluR5 belong to group I, mGluR2 and mGluR3 belong to group II and mGluR4, mGluR6, mGluR7 and mGluR8 belong to group III.

**[0004]** Ligands of metabotropic glutamate receptors belonging to the first group can be used for the treatment or prevention of acute and/or chronic neurological disorders such as psychosis, epilepsy, schizophrenia, Alzheimer's disease, cognitive disorders and memory deficits, as well as chronic and acute pain.

**[0005]** Other treatable indications in this connection are restricted brain function caused by bypass operations or transplants, poor blood supply to the brain, spinal cord injuries, head injuries, hypoxia caused by pregnancy, cardiac arrest and hypoglycemia. Further treatable indications are gastroesophageal reflux disease (GERD), fragile X syndrome, ischemia, Huntington's chorea, amyotrophic lateral sclerosis (ALS), dementia caused by AIDS, eye injuries, retinopathy, idiopathic parkinsonism or parkinsonism caused by medicaments as well as conditions which lead to glutamate-deficiency functions, such as e.g. muscle spasms, convulsions, migraine, urinary incontinence, obesity, nicotine addiction, opiate addiction, anxiety, vomiting, dyskinesia and depressions.

**[0006]** Disorders mediated full or in part by mGluR5 are for example acute, traumatic and chronic degenerative processes of the nervous system, such as Alzheimer's disease, senile dementia, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis and multiple sclerosis, psychiatric diseases such as schizophrenia and anxiety, depression, pain and drug dependency (*Expert Opin. Ther. Patents* (2002), 12, (12)).

[0009] Bonnefous et al. in Dipyridyl amides: potent metabotropic glutamate subtype 5 (mGlu5) receptor antagonists; *Bioorganic & Medicinal Chemistry Letters*, 2005, described compounds useful as group I metabotropic glutamate receptor antagonists without disclosing the compounds of the instant invention. Furthermore, Bonnefous et al., disclosed that generally compounds of formula (I) where  $R'$  is pyridine-3-yl or pyridine-4-yl are inactive.

[0010] Contrary to this finding, the 5-position of said pyridine-2-yl compounds are indeed amenable to substitution by a fluorine atom, and the resulting compounds of formula I where  $R'$  is pyridine-4-yl are active as mGluR5 receptor antagonists. In addition, further pyridine-2-carboxamide derivatives other than pyridine-2-yl derivatives are active as mGluR5 receptor antagonists.

[0011] Compounds of general formula I are metabotropic glutamate receptor antagonists. Compounds of formula I are distinguished by having valuable therapeutic properties. They can be used for the treatment of mGluR5 receptor mediated disorders.

[0012] The present invention also provides pharmaceutical compositions containing compounds of the invention and methods for preparing the compounds and compositions of the invention. The invention further provides methods for treating mGluR5 receptor mediated disorders. For example, the invention provides methods for treating acute and/or chronic neurological disorders, in particular anxiety and chronic or acute pain.

**[0207]** Pharmaceutically acceptable salts of compounds of formula I can be manufactured readily according to methods known per se and taking into consideration the nature of the compound to be converted into a salt. Inorganic or organic acids such as, for example, hydrochloric acid, hydrobromic acid, sulphuric acid, nitric acid, phosphoric acid or citric acid, formic acid, fumaric acid, maleic acid, acetic acid, succinic acid, tartaric acid, methanesulphonic acid, p-toluene-sulphonic acid and the like are suitable for the formation of pharmaceutically acceptable salts of basic compounds of formula I. Compounds which contain the alkali metals or alkaline earth metals, for example sodium, potassium, calcium, magnesium or the like, basic amines or basic amino acids are suitable for the formation of pharmaceutically acceptable salts of acidic compounds.

**[0208]** As already mentioned above, the compounds of formula (I) and their pharmaceutically acceptable salts are, as already mentioned above, metabotropic glutamate receptor antagonists and can be used for the treatment of mGluR5 receptor mediated disorders, such as acute and/or chronic neurological disorders, cognitive disorders and memory deficits, as well as acute and chronic pain. Treatable neurological disorders are, for instance, epilepsy, schizophrenia, anxiety, acute, traumatic or chronic degenerative processes of the nervous system, such as Alzheimer's disease, senile dementia, Huntington's chorea, ALS, multiple sclerosis, dementia caused by AIDS, eye injuries, retinopathy, idiopathic parkinsonism or parkinsonism caused by medicaments as well as conditions which lead to glutamate-deficient functions, such as e.g. muscle spasms, convulsions, migraine, urinary incontinence, ethanol addiction, nicotine addiction, psychoses, opiate addiction, anxiety, vomiting, dyskinesia and depression. Other treatable indications are restricted brain function caused by bypass operations or transplants, poor blood supply to the brain, spinal cord injuries, head injuries, hypoxia caused by pregnancy, cardiac arrest and hypoglycemia. Furthermore restricted brain function leading to mental retardation due to abnormalities during pregnancy, retarded brain development or genetic anomalies such as Fragile-X syndrome, Down syndrome, or Autism spectrum disorders (Kanner's syndrome, Pervasive developmental disorder (PDD), Asperger's syndrome), attention deficit disorder (ADD), behavioral disorders such as obsessive compulsive disorder (OCD), eating disorders (anorexia, bulimia), are also possible treatable indications.

**[0209]** The compounds of formula I and their pharmaceutically acceptable salts are especially useful as analgesics. Treatable kinds of pain include inflammatory pain such as arthritis and rheumatoid disease, vasculitis, neuropathic pain such as trigeminal or herpetic neuralgia, diabetic neuropathy pain, causalgia, hyperalgesia, severe chronic pain, post-operative pain and pain associated with various conditions like cancer, angina, renal or biliary colic, menstruation, migraine and gout.

**[0210]** The pharmacological activity of the compounds was tested using the following method: For binding experiments, cDNA encoding human mGlu 5a receptor was transiently transfected into EBNA cells using a procedure described by Schlaeger and Christensen [Cytotechnology 15:1-13 (1998)]. Cell membrane homogenates were stored at  $-80^{\circ}\text{C}$ . until the day of assay where upon they were thawed and resuspended and polytronized in 15 mM Tris-HCl, 120 mM NaCl, 100 mM KCl, 25 mM  $\text{CaCl}_2$ , 25 mM  $\text{MgCl}_2$  binding buffer at pH 7.4 to a final assay concentration of 20  $\mu\text{g}$  protein/well.

**[0211]** Saturation isotherms were determined by addition of twelve [ $^3\text{H}$ ]MPEP concentrations (0.04-100 nM) to these membranes (in a total volume of 200  $\mu\text{l}$ ) for 1 h at  $4^{\circ}\text{C}$ . Competition experiments were performed with a fixed concentration of [ $^3\text{H}$ ]MPEP (2 nM), and  $\text{IC}_{50}$  values of test compounds evaluated using 11 concentrations (0.3-10,000 nM). Incubations were performed for 1 h at  $4^{\circ}\text{C}$ .

**[0212]** At the end of the incubation, membranes were filtered onto unfilter (96-well white microplate with bonded GF/C filter preincubated 1 h in 0.1% PEI in wash buffer, Packard Bio-Science, Meriden, Conn.) with a Filtermate 96 harvester (Packard BioScience) and washed 3 times with cold 50 mM Tris-HCl, pH 7.4 buffer. Nonspecific binding was measured in the presence of 10  $\mu\text{M}$  MPEP. The radioactivity on the filter was counted (3 min) on a Packard Top-count

microplate scintillation counter with quenching correction after addition of 45  $\mu\text{l}$  of microscint 40 (Canberra Packard S. A., Zürich, Switzerland) and shaking for 20 min.

**[0213]** For functional assays,  $[\text{Ca}^{2+}]_i$  measurements were performed as described previously by Porter et al. [Br. J. Pharmacol. 128:13-20 (1999)] on recombinant human mGlu 5a receptors in HEK-293 cells. The cells were dye loaded using Fluo 4-AM (obtainable by FLUKA, 0.2  $\mu\text{M}$  final concentration).  $[\text{Ca}^{2+}]_i$  measurements were performed using a fluorometric imaging plate reader (FLIPR, Molecular Devices Corporation, La Jolla, Calif., USA). Antagonist evaluation was performed following a 5 min preincubation with the test compounds followed by the addition of a sub-maximal addition of agonist.

**[0214]** The inhibition (antagonists) curves were fitted with a four parameter logistic equation giving  $\text{IC}_{50}$ , and Hill coefficient using iterative non linear curve fitting software (Xcel fit).

**[0215]** For binding experiments the  $K_i$  values of the compounds tested are given. The  $K_i$  value is defined by the following formula:

$$K_i = \text{IC}_{50} / [1 + L/K_d]$$

in which the  $\text{IC}_{50}$  values are those concentrations of the compounds tested which cause 50% inhibition of the competing radioligand ( $[^3\text{H}]\text{MPEP}$ ). L is the concentration of radioligand used in the binding experiment and the  $K_d$  value of the radioligand is empirically determined for each batch of membranes prepared.

**[0216]** The compounds of the present invention are mGluR 5a receptor antagonists. The activities of compounds of formula I as measured in the assay described above are in the range of  $K_i < 4 \mu\text{M}$  and preferably  $< 150 \text{ nM}$ .

**[0217]** The present invention also provides pharmaceutical compositions containing compounds of the invention or pharmaceutically acceptable salts thereof and a pharmaceutically acceptable carrier. Such pharmaceutical compositions can be in the form of tablets, coated tablets, dragées, hard and soft gelatin capsules, solutions, emulsions or suspensions. The pharmaceutical compositions also can be in the form of suppositories or injectable solutions.

**[0218]** The pharmaceutical compositions of the invention, in addition to one or more compounds of the invention, contain a pharmaceutically acceptable carrier. Suitable pharmaceutically acceptable carriers include pharmaceutically inert, inorganic or organic carriers. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be

used, for example, as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like; depending on the nature of the active substance no carriers are, however, usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar, glucose and the like. Adjuvants, such as alcohols, polyols, glycerol, vegetable oils and the like, can be used for aqueous injection solutions of water-soluble salts of compounds of formula I, but as a rule are not necessary. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

[0219] In addition, the pharmaceutical compositions can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or anti-oxidants. They can also contain still other therapeutically valuable substances.

[0220] The present invention also provides a process for the manufacture of pharmaceutical compositions. Such process comprises bringing the compound of formula I and/or pharmaceutically acceptable salts thereof and, if desired, one or more other therapeutically valuable substances into a galenic administration form together with one or more therapeutically inert carriers.

[0221] The present invention further provides methods for the treatment of mGluR5 mediated disorders. In particular, the invention provides a method for treating a disorder selected from the group consisting of acute and/or chronic neurological disorders, anxiety, behavioral disorders, and obsessive compulsive disorder (OCD). The invention also provides a method for treating a disorder selected from anorexia and bulimia. The invention further provides a method for treating a disorder selected from the group consisting of schizophrenia, Alzheimer's disease, and Parkinson's disease. Such methods comprise administering to an individual a therapeutically effective amount of a compound of the invention and a pharmaceutically acceptable carrier.

[0222] The dosage at which compounds of the invention can be administered can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, the effective dosage for oral or parenteral administration is between 0.01-20 mg/kg/day, with a dosage of 0.1-10 mg/kg/day being preferred for all of the indications described. The daily dosage for an adult human being weighing 70 kg accordingly lies between 0.7-1400 mg per day, preferably between 7 and 700 mg per day.

[0223] The following examples are provided to further elucidate the invention and are not intended to limit the invention to the sole compounds exemplified:

#### EXAMPLE 1

6-Methyl-3-(pyridin-3-ylamino)-pyridine-2-carboxylic acid (3-chloro-phenyl)-amide

##### Step 1

6-Methyl-pyridine-2-carboxylic acid-(3-chloro-phenyl)-amide

[0224] A solution of 6-methylpicolinic acid (5.0 g, 36 mmol) in THF (60.0 ml) was treated with two drops of DMF and 3.5 ml (5.09 g, 40 mmol, 1.1 equiv.) of oxalyl chloride

were added dropwise. The solution was stirred for 30 min at room temperature. The reaction mixture was then evaporated to dryness in vacuo. The residue was taken up in 40 ml of dry THF, and cooled to 0° C. Triethylamine (6.1 ml, 4.43 g, 44 mmol, 1.2 equiv.), and a solution of 4.23 ml (5.12 g, 40 mmol, 1.1 equiv.) of 3-chloro-aniline in 15 ml of dry THF were added dropwise at 0° C. The reaction mixture was stirred for 5 min. at 0° C. and then allowed to warm up to room temperature. After stirring for 1 h at r.t., the dark brown suspension was filtered. The filtrate was concentrated in vacuo, and the residue was dissolved in 200 ml of ethyl acetate, which was washed once with brine. The aqueous phase was extracted with ethyl acetate. The combined organic phases were dried over magnesium sulfate, filtered and concentrated in vacuo. Concentration in vacuo yielded 7.7 g of a dark brown residue which was purified by flash chromatography (heptane/ethyl acetate 4:1) to yield the title compound as a white solid (total 5.05 g, 56%), MS (ISP): m/e=247.1, 249.1 (M+H<sup>+</sup>).

##### Step 2

3-Iodo-6-methyl-pyridine-2-carboxylic acid  
(3-chloro-phenyl)-amide

[0225] A solution of 6-Methyl-pyridine-2-carboxylic acid-(3-chloro-phenyl)-amide (1.96 g, 7.9 mmol) in THF (20.0 ml) was cooled to -78° C. A 1.6 M solution of n-BuLi in hexane (11.0 ml, 17.6 mmol, 2.2 equiv.) was added dropwise and the reaction was stirred for 30 min at -78° C. A solution of 2.02 g (7.9 mmol) of iodine in THF (20.0 ml) was added dropwise maintaining the temperature below -75° C. After 5 min, the reaction mixture was allowed to warm up to r.t. The mixture was quenched by the addition of sat. ammonium sulfate soln. (5 ml) and 40% sodium hydrogensulfite solution (5 ml). The pH of the solution was adjusted to 8 by the addition of sat. bicarbonate soln. The mixture was then extracted twice with ethyl acetate. The combined organic phases were washed with water, dried over magnesium sulfate and concentrated in vacuo. The dark brown residue (2.66 g) was purified by flash chromatography (heptane/ethyl acetate 9:1) to yield the title compound as a beige solid (total 1.42 g, 48%), MS (ISP): m/e=373.0, 375.0 (M+H<sup>+</sup>).

##### Step 3

6-Methyl-3-(pyridin-3-ylamino)-pyridine-2-carboxylic acid (3-chloro-phenyl)-amide

[0226] In a 5 ml microwave reaction vessel were dissolved 50 mg (0.134 mmol) 3-Iodo-6-methyl-pyridine-2-carboxylic acid (3-chloro-phenyl)-amide and 16 mg (0.168 mmol, 1.25 equiv.) of 3-aminopyridine in 2 ml of dioxane. Cesium carbonate (61 mg, 188 mmol, 1.4 equiv.) were added and argon was bubbled through the suspension for 3 min. Then Xanthphos (26 mg, 0.044 mmol, 0.33 equiv.) and Pd<sub>2</sub>(dba)<sub>3</sub>·CHCl<sub>3</sub> 14 mg (0.013 mmol, 0.1 equiv.) were added and the mixture was heated for 30 min at 150° C. under microwave irradiation. The mixture was diluted with methylene chloride, filtered and concentrated in vacuo. The resulting dark brown oil (129 mg) was purified by flash chromatography (gradient: heptane/ethyl acetate 4:1 to 3:2) to yield the title compound as a yellow solid (total 11 mg, 24%), MS (ISP): m/e=339.1, 341.1 (M+H<sup>+</sup>).

#### EXAMPLE 2

6-Methyl-3-(pyrimidin-5-ylamino)-pyridine-2-carboxylic acid (3-chloro-phenyl)-amide

[0227] The title compound, MS (ISP): m/e=340.1, 342.0 (M+H<sup>+</sup>), was prepared from 3-Iodo-6-methyl-pyridine-2-

carboxylic acid (3-chloro-phenyl)-amide in accordance with the general method of example 1. Step 3 was performed using 5-aminopyrimidine (CAS: [591-55-9]) instead of 3-aminopyridine.

#### EXAMPLE 3

##### 3-(5-Chloro-pyridin-3-ylamino)-6-methyl-pyridine-2-carboxylic acid (3-chloro-phenyl)amide

**[0228]** The title compound, MS (ISP):  $m/e=373.1$ ,  $375.1$  ( $M+H^+$ ), was prepared from 3-Iodo-6-methyl-pyridine-2-carboxylic acid (3-chloro-phenyl)-amide in accordance with the general method of example 1. Step 3 was performed using 3-amino-5-chloropyridine (CAS: [22353-34-0]) instead of 3-aminopyridine.

This crude salt was then added in portions to 200 ml of toluene heated at  $80^{\circ}\text{C}$ . After stirring for 1 h at  $90^{\circ}\text{C}$ ., the organic phase was concentrated. The light yellow residue was suspended in 150 ml of water and the pH was adjusted to 11 with 32% sodium hydroxide solution. The resulting solution was extracted three times with 200 ml of methylene chloride. The combined organic phases were washed with water, dried over magnesium sulfate and concentrated. The crude material 15.4 g (brown oil) was purified by vacuum distillation (10 mBar,  $35^{\circ}\text{C}$ .) and yielded 5.6 g (0.032 mol, 55%) of the title compound as a colorless oil (ISP):  $m/e=176.1, 178.1$  (M+H+).
