## Description

## Field of the Invention

**[0001]** The present invention relates to novel compounds, processes for their preparation, pharmaceutical compositions containing them and their use in therapy.

## Background of the Invention

**[0002]** Chemokines play an important role in immune and inflammatory responses in various diseases and disorders, including asthma and allergic diseases, as well as autoimmune pathologies such as rheumatoid arthritis and atherosclerosis. These small secreted molecules are a growing superfamily of 8-14 kDa proteins characterised by a conserved four cysteine motif. The chemokine superfamily can be divided into two main groups exhibiting characteristic structural motifs, the Cys-X-Cys (C-X-C) and Cys-Cys (C-C) families. These are distinguished on the basis of a single amino acid insertion between the NH-proximal pair of cysteine residues and sequence similarity.

**[0003]** The C-X-C chemokines include several potent chemoattractants and activators of neutrophils such as interleukin-8 (IL-8) and neutrophil-activating peptide 2 (NAP-2).

**[0004]** The C-C chemokines include potent chemoattractants of monocytes and lymphocytes but not neutrophils such as human monocyte chemotactic proteins 1-3 (MCP-1, MCP-2 and MCP-3), RANTES (Regulated on Activation, Normal T Expressed and Secreted), eotaxin and the macrophage inflammatory proteins 1 $\alpha$  and 1 $\beta$  (MIP-1 $\alpha$  and MIP-1 $\beta$ ).

**[0005]** Studies have demonstrated that the actions of the chemokines are mediated by subfamilies of G protein-coupled receptors, among which are the receptors designated CCR1, CCR2, CCR2A, CCR2B, CCR3, CCR4, CCR5, CCR6, CCR7, CXCR1, CXCR2, CXCR3 and CXCR4. These receptors represent good targets for drug development since agents which modulate these receptors would be useful in the treatment of disorders and diseases such as those mentioned above.

**[0006]** EP 0 903 349 (Hoffmann-La Roche) discloses compounds of general formula

that are CCR-3 receptor antagonists.

## Disclosure of the Invention

**[0007]** In accordance with the present invention, there is provided a compound of general formula (I)

wherein:

**[0024]** Salts of compounds of formula (I) may be formed by reacting the free base or another salt thereof, with one or more equivalents of the appropriate acid. The reaction may be carried out in a solvent in which the salt is insoluble, or in a solvent in which the salt is soluble, followed by subsequent removal of the solvent *in vacuo* or by freeze drying. Suitable solvents include, for example, water, dioxan, ethanol, 2-propanol, tetrahydrofuran or diethyl ether, or mixtures thereof. The reaction may also be carried out on an ion exchange resin.

**[0025]** In processes (i) and (iv) above, the reaction will take place on stirring a mixture of the reactants in a suitable organic solvent at a suitable temperature, generally between 0 °C and the boiling point of the solvent. The reaction time will depend *inter alia* on the solvent used, the reaction temperature and the nature of the leaving group. The reaction may be catalysed by the addition of a base; bases that may be used include organic amines (for example, triethylamine or pyridine) and alkali metal hydroxides, alkoxides, carbonates or hydrides. Suitable leaving groups,  $L^1$  and  $L^3$ , include halogen (especially chlorine) and hydroxyl. When the leaving group is OH, the reaction between compounds of formulae (II) and (III), or between compounds of formulae (VII) and  $HNR^6R^7$  may also be achieved using a suitable coupling agent such as CDI (1,1'-carbonyldiimidazole), DCC (1,3-dicyclohexylcarbodiimide) or HOBt (1-hydroxybenzotriazole).

**[0026]** In processes (ii) and (vi), the reaction is performed by treating an amine of general formula (IV) or (XII) with an electrophile of general formula (V) or (XI) respectively in an inert solvent. Suitable leaving groups  $L^2$  and  $L^5$  include sulfonate, trifluorosulfonate, tosylate, and halides selected from the group chloride, bromide or iodide. The reaction is generally performed in the presence of a base. This base can be either an excess of the amine nucleophile or can be an additive to the reaction mixture. Potential basic additives are metal carbonates, especially alkali metal carbonates such as cesium carbonate, metal oxides and hydroxides, and tertiary amine bases. Suitable organic solvents are those such as acetonitrile, dioxane, N,N-dimethylformamide, N-methyl-2-pyrrolidinone, tetrahydrofuran, dimethylsulfoxide, sulfolane and C1 to 4 alcohols. In a preferred embodiment, the leaving group is chloride.

**[0027]** In process (iii), the reductive amination reaction generally takes place under conditions which will be known to persons skilled in the art. For example, treatment of an aldehyde with an amine in the presence of a reducing agent in an inert solvent. Suitable reducing systems include catalytic hydrogenation or borane and derivatives thereof. A partial list of such reagents can be found in "Advanced Organic Chemistry", J. March (1985) 3rd Edition on page 799.

**[0028]** In process (v) and (vii), the reaction will generally take place under similar conditions to those described above

for processes (ii) and (vi).

**[0029]** Compounds of formula (1X) may be prepared by demethylation of a corresponding compound of formula (XIII)

wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $R^5$ ,  $X$ ,  $m$  and  $n$  are as defined in formula (I), using, for example, boron tribromide.

**[0030]** In general, compounds of formulae (II), (IV), (VII), (IX), (XI) and (XIII) may be prepared using similar types of reactions to those described above for compounds of formula (I).

**[0031]** Novel intermediates of formulae (II), (IV), (VII), (IX), (XI) and (XIII) form another aspect of the invention.

**[0032]** Compounds of formulae (III), (V), (VI), (VIII), (X) and (XII) are either commercially available, or are known in the literature or may be prepared using methods which will be readily apparent to the man skilled in the art.

**[0033]** It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups such as hydroxyl or amino groups in the starting reagents or intermediate compounds may need to be protected by protecting groups. Thus, the preparation of the compounds of formula (I) may involve, at an appropriate stage, the addition and subsequent removal of one or more protecting groups.

**[0034]** The protection and deprotection of functional groups is described in 'Protective Groups in Organic Chemistry', edited by J.W.F. McOmie, Plenum Press (1973) and 'Protective Groups in Organic Synthesis', 2nd edition, T.W. Greene and P.G.M. Wuts, Wiley-Interscience (1991).

**[0035]** Certain compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses the use of all geometric and optical isomers of the compounds of formula (I) and mixtures thereof including racemates. The use of tautomers and mixtures thereof also form an aspect of the present invention.

**[0036]** The compounds of the invention and intermediates may be isolated from their reaction mixtures, and if necessary further purified, by using standard techniques.

**[0037]** The compounds of formula (I) have activity as pharmaceuticals, in particular as modulators of chemokine receptor activity. More particularly, the compounds have utility as modulators of the activity of chemokine receptors CCR1 and/or CCR3.

**[0038]** A further aspect of the invention involves the use of a compound of general formula (I) in the treatment of conditions or diseases in which modulation of chemokine receptor activity is beneficial.

**[0039]** Thus, compounds of general formula (I) may be used in the treatment of autoimmune, inflammatory, proliferative and hyperproliferative diseases and immunologically-mediated diseases including rejection of transplanted organs or tissues and Acquired Immunodeficiency Syndrome (AIDS).

**[0040]** Examples of these conditions include:

(1) **(the respiratory tract)** obstructive airways diseases including chronic obstructive pulmonary disease (COPD); asthma, such as bronchial, allergic, intrinsic, extrinsic and dust asthma, particularly chronic or inveterate asthma (e.g. late asthma and airways hyper-responsiveness); bronchitis; acute, allergic, atrophic rhinitis and chronic rhinitis including rhinitis caseosa, hypertrophic rhinitis, rhinitis purulenta, rhinitis sicca and rhinitis medicamentosa; membranous rhinitis including croupous, fibrinous and pseudomembranous rhinitis and scrofulous rhinitis; seasonal rhinitis including rhinitis nervosa (hay fever) and vasomotor rhinitis; sarcoidosis, farmer's lung and related diseases, fibroid lung and idiopathic interstitial pneumonia;

[0041] Thus, the present invention provides a compound of formula (I), or a pharmaceutically-acceptable salt or solvate thereof, as hereinbefore defined for use in therapy.

[0042] In a further aspect, the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined in the manufacture of a medicament for use in therapy.

[0043] In the context of the present specification, the term "therapy" also includes "prophylaxis" unless there are specific indications to the contrary. The terms "therapeutic" and "therapeutically" should be construed accordingly.

[0044] Prophylaxis is expected to be particularly relevant to the treatment of persons who have suffered a previous episode of, or are otherwise considered to be at increased risk of, the disease or condition in question. Persons at risk of developing a particular disease or condition generally include those having a family history of the disease or condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the disease or condition.

[0045] The invention also provides the use of a compound of formula (I) in the manufacture of a medicament for use in a method of treating an inflammatory disease in a person suffering from, or at risk of, said disease, which comprises administering to the person a therapeutically effective amount of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined.

[0046] For the above-mentioned therapeutic uses the dosage administered will, of course, vary with the compound employed, the mode of administration; the treatment desired and the disorder indicated.

[0047] The compounds of formula (I) and pharmaceutically acceptable salts and solvates thereof may be used on their own but will generally be administered in the form of a pharmaceutical composition in which the formula (I) compound/salt/solvate (active ingredient) is in association with a pharmaceutically acceptable adjuvant, diluent or carrier. Depending on the mode of administration, the pharmaceutical composition will preferably comprise from 0.05 to 99 %w (per cent by weight), more preferably from 0.05 to 80 %w, still more preferably from 0.10 to 70 %w, and even more preferably from 0.10 to 50 %w, of active ingredient, all percentages by weight being based on total composition.

[0048] The present invention also provides a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined, in association with a pharmaceutically acceptable adjuvant, diluent or carrier.

[0049] The invention further provides a process for the preparation of a pharmaceutical composition of the invention which comprises mixing a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined, with a pharmaceutically acceptable adjuvant, diluent or carrier.

[0050] The pharmaceutical compositions may be administered topically (e.g. to the lung and/or airways or to the skin) in the form of solutions, suspensions, heptafluoroalkane aerosols and dry powder formulations; or systemically, e.g. by oral administration in the form of tablets, capsules, syrups, powders or granules, or by parenteral administration in the form of solutions or suspensions, or by subcutaneous administration or by rectal administration in the form of suppositories or transdermally.

[0051] The invention will now be further explained by reference to the following illustrative examples.

## Pharmacological Analysis

### Calcium flux $[Ca^{2+}]_i$ assay

#### a) Human eosinophils

**[0128]** Human eosinophils were isolated from EDTA anticoagulated peripheral blood as previously described (Hansel et al., J. Immunol. Methods, 1991, 145, 105-110). The cells were resuspended ( $5 \times 10^6 \text{ ml}^{-1}$ ) and loaded with  $5 \mu\text{M}$  FLUO-3/AM + Pluronic F127  $2.2 \mu\text{l/ml}$  (Molecular Probes) in low potassium solution (LKS; NaCl  $118 \text{ mM}$ ,  $\text{MgSO}_4$   $0.8 \text{ mM}$ , glucose  $5.5 \text{ mM}$ ,  $\text{Na}_2\text{CO}_3$   $8.5 \text{ mM}$ , KCl  $5 \text{ mM}$ , HEPES  $20 \text{ mM}$ ,  $\text{CaCl}_2$   $1.8 \text{ mM}$ , BSA  $0.1 \%$ , pH 7.4) for one hour at room temperature. After loading, cells were centrifuged at  $200g$  for  $5 \text{ min}$  and resuspended in LKS at  $2.5 \times 10^6 \text{ ml}^{-1}$ . The cells were then transferred to 96 well FLIPr plates (Poly-D-Lysine plates from Becton Dickinson pre-incubated with  $5 \mu\text{M}$  fibronectin for two hours) at  $100 \text{ ml/well}$ . The plate was centrifuged at  $200g$  for  $5 \text{ min}$  and the cells were washed twice with LKS ( $200 \mu\text{l}$ ; room temperature).

**[0129]** A compound of the Examples was pre-dissolved in DMSO and added to a final concentration of  $0.1 \%$  (v/v) DMSO. Assays were initiated by the addition of an  $A_{50}$  concentration of eotaxin and the transient increase in fluo-3 fluorescence ( $1_{\text{Ex}} = 490 \text{ nm}$  and  $1_{\text{Em}} = 520 \text{ nm}$ ) monitored using a FLIPR (Fluorometric Imaging Plate Reader, Molecular Devices, Sunnyvale, U.S.A.).

#### b) Human monocytes

**[0130]** Human monocytes were isolated from EDTA anticoagulated peripheral blood as previously described (Cunnoosamy & Holbrook, J. Leukocyte Biology, 1998, S2, 13). Cells were ( $5 \times 10^6 \text{ ml}^{-1}$ ) in LKS and loaded with  $5 \mu\text{M}$  FLUO-3/AM + Pluronic F127  $2.2 \mu\text{l/ml}$  (Molecular Probes) for one hour at room temperature. After loading, cells were centrifuged at  $200g$  for  $5 \text{ min}$  and resuspended in LKS at  $0.5 \times 10^6 \text{ ml}^{-1}$ . The cells were then transferred to 96 well FLIPr plates (Costar). To each well  $100 \mu\text{l}$  of cells were added at a concentration of  $0.5 \times 10^6 \text{ ml}^{-1}$ . The plates were centrifuged ( $200g$ ;  $5 \text{ min}$ ; room temperature) to allow the cells to adhere. After centrifugation the cells were washed twice with LKS ( $200 \mu\text{l}$ ; room temperature).

**[0131]** A compound of the Examples was pre-dissolved in DMSO and added to a final concentration of  $0.1 \%$  (v/v) DMSO. Assays were initiated by the addition of an  $A_{50}$  concentration of MIP-1 $\alpha$  and the transient increase in fluo-3 fluorescence ( $1_{\text{Ex}} = 490 \text{ nm}$  and  $1_{\text{Em}} = 520 \text{ nm}$ ) monitored using a FLIPR (Fluorometric Imaging Plate Reader, Molecular Devices, Sunnyvale, U.S.A.).

**[0132]** The compounds of the Examples were found to be antagonists of the eotaxin mediated  $[Ca^{2+}]_i$  in human eosinophils and/or antagonists of the MIP-1 $\alpha$  mediated  $[Ca^{2+}]_i$  in human monocytes.

#### Human eosinophil chemotaxis

**[0133]** Human eosinophils were isolated from EDTA anticoagulated peripheral blood as previously described (Hansel et al., J. Immunol. Methods, 1991, 145, 105-110). The cells were resuspended at  $10 \times 10^6 \text{ ml}^{-1}$  in RPMI containing  $200 \text{ IU/ml}$  penicillin,  $200 \mu\text{g/ml}$  streptomycin sulphate and supplemented with  $10\%$  HIFCS, at room temperature.

[0134] Eosinophils (700  $\mu$ l) were pre-incubated for 15 mins at 37° C with 7  $\mu$ l of either vehicle or compound (100x required final concentration in 10% DMSO). The chemotaxis plate (ChemoTx, 3 $\mu$ m pore, Neuroprobe) was loaded by adding 28 $\mu$ l of a concentration of eotaxin (0.1 to 100nM) containing a concentration of a compound according to the Examples or solvent to the lower wells of the chemotaxis plate. The filter was then placed over the wells and 25  $\mu$ l of eosinophil suspension were added to the top of the filter. The plate was incubated for 1 hr at 37°C in a humidified incubator with a 95% air/5% CO<sub>2</sub> atmosphere to allow chemotaxis.

[0135] The medium, containing cells that had not migrated, was carefully aspirated from above the filter and discarded. The filter was washed once with phosphate buffered saline (PBS) containing 5 mM EDTA to remove any adherent cells. Cells that had migrated through the filter were pelleted by centrifugation (300xg for 5 mins at room temperature) and the filter removed and the supernatant transferred to each well of a 96-well plate (Costar). The pelleted cells were lysed by the addition of 28  $\mu$ l of PBS containing 0.5% Triton x 100 followed by two cycles of freeze/thawing. The cell lysate was then added to the supernatant. The number of eosinophils migrating was quantified according to the method of Strath et al., J. Immunol. Methods, 1985, 83, 209 by measuring eosinophil peroxidase activity in the supernatant.

[0136] Certain compounds of the Examples were found to be antagonists of the eotaxin mediated human eosinophil chemotaxis.
