AMIDE SUBSTITUTED IMIDAZOQUINOLINES

CROSS REFERENCE TO RELATED APPLICATIONS

This is a continuation of application Ser. No. 10/027,218, filed Dec. 21, 2001, now U.S. Pat. No. 6,756,382, which is continuation-in-part of application Ser. No. 09/589,580, filed Jun. 7, 2000, now U.S. Pat. No. 6,451,810, which claims the benefit of U.S. Provisional Application No. 60/138,365, filed Jun. 10, 1999.

FIELD OF THE INVENTION

This invention relates to imidazoquinoline compounds that have an amide containing substituent at the 1-position, and to pharmaceutical compositions containing such compounds. A further aspect of this invention relates to the use of these compounds as immunomodulators, for inducing cytokine biosynthesis in animals, and in the treatment of diseases, including viral and neoplastic diseases.

BACKGROUND OF THE INVENTION

The first reliable report on the 1H-imidazo[4,5-c]quinoline ring system, Backman et al., *J. Org. Chem.* 15, 1278-1284 (1950) describes the synthesis of 1-(6-methoxy-8-quinolinyl)-2-methyl-1H-imidazo[4,5-c]quinoline for possible use as an antimalarial agent. Subsequently, syntheses of various substituted 1H-imidazo[4,5-c]quinolines were reported. For example, Jain et al., *J. Med. Chem.* 11, pp. 87-92 (1968), synthesized the compound 1-[2-(4-piperidyl)ethyl]-1H-imidazo[4,5-c]quinoline as a possible anticonvulsant and cardiovascular agent. Also, Baranov et al., *Chem. Abs.* 85, 94362 (1976), have reported several 2-oxoimidazo[4,5-c]quinolines, and Berenyi et al., *J. Heterocyclic Chem.* 18, 1537-1540 (1981), have reported certain 2-oxoimidazo[4,5-c]quinolines.

Certain 1H-imidazo[4,5-c]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. These are described in, inter alia, U.S. Pat. Nos. 4,689,338; 4,698,348; 4,929,624; 5,037,986; 5,268,376; 5,346,905; and 5,389,640, all of which are incorporated herein by reference.

There continues to be interest in the imidazoquinoline ring system. For example, EP 894 797 describes imidazoquinoline compounds that bear an amide containing substituent at the 1-position. The active compounds of this series require a terminal amine substituent that may be incorporated into a heterocyclic ring. As another example, WO 00/09506 describes imidazopyridine and imidazoquinoline compounds that may have an amide or urea containing substituent at the 1-position. The compounds described in this publication as having utility contain a 1-substituent wherein the amide or urea nitrogen is part of a heterocyclic ring. Despite these attempts to identify compounds that are useful as immune response modifiers, there is a continuing need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other mechanisms.

SUMMARY OF THE INVENTION

We have found a new class of compounds that are useful in inducing cytokine biosynthesis in animals. Accordingly, this invention provides imidazoquinoline-4-amine and tetrahydroimidazoquinoline-4-amine compounds that have an amide

2

containing substituent at the 1-position. The compounds which have been found to be useful inducers of cytokine biosynthesis are defined by Formulae (I), (Ia), and (Ib), which are defined in more detail infra. These compounds share the general structural formula (I):

(I)

wherein R₁, R₂, and R are as defined herein for each class of compounds having formulas (I), (Ia), and (Ib). The invention also provides novel compounds of formulas (Ic), (Id), and (Ie) as defined herein, which compounds are also useful as immune response modifiers and which also have the same general structural formula (I) above.

The compounds of Formulae (I), (Ia), (Ib), (Ic), (Id), and (Ie) are useful as immune response modifiers due to their ability to induce cytokine biosynthesis and otherwise modulate the immune response when administered to animals. This makes the compounds useful in the treatment of a variety of conditions such as viral diseases and tumors that are responsive to such changes in the immune response.

The invention further provides pharmaceutical compositions containing the immune response modifying compounds, and methods of inducing cytokine biosynthesis in an animal, treating a viral infection in an animal, and/or treating a neoplastic disease in an animal by administering a compound of Formula (I), (Ia), (Ib), (Ic), (Id), or (Ie) to the animal.

In addition, methods of synthesizing the compounds of the invention and intermediates useful in the synthesis of these compounds are provided.

DETAILED DESCRIPTION OF THE INVENTION

As mentioned earlier, we have found that certain compounds induce cytokine biosynthesis and modify the immune response in animals. Such compounds are represented by Formulae (I), (Ia), (Ib), (Ic), (Id), and (Ie), as shown below.

The invention provides pharmaceutical compositions containing a therapeutically effective amount of a compound of Formula (I):

Preparation of the Compounds

Imidazoquinolines of the invention can be prepared according to Reaction Scheme I where R, R₁, R₂ and n are as defined above.

In step (1) of Reaction Scheme I a 4-chloro-3-nitroquinoline of Formula II is reacted with an amine of Formula R₁NH₂ to provide a 3-nitroquinolin-4-amine of Formula III. The reaction can be carried out by adding amine to a solution of a

12

compound of Formula II in a suitable solvent such as chloroform or dichloromethane and optionally heating. Many quinolines of Formula II are known compounds (see for example, U.S. Pat. No. 4,689,338 and references cited therein).

In step (2) of Reaction Scheme I a 3-nitroquinolin-4-amine of Formula III is reduced to provide a quinoline-3,4-diamine of Formula IV. Preferably, the reduction is carried out using a conventional heterogeneous hydrogenation catalyst such as platinum on carbon or palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as isopropyl alcohol or toluene.

In step (3) of Reaction Scheme I a quinoline-3,4-diamine of Formula IV is reacted with a carboxylic acid or an equivalent thereof to provide a 1H-imidazo[4,5-c]quinoline of Formula V. Suitable equivalents to carboxylic acid include acid halides, orthoesters, and 1,1-dialkoxyalkyl alkanoates. The carboxylic acid or equivalent is selected such that it will provide the desired R₂ substituent in a compound of Formula V. For example, triethyl orthoformate will provide a compound where R₂ is hydrogen and triethyl orthoacetate will provide a compound where R₂ is methyl. The reaction can be run in the absence of solvent or in an inert solvent such as toluene. The reaction is run with sufficient heating to drive off any alcohol or water formed as a byproduct of the reaction.

In step (4) of Reaction Scheme I a 1H-imidazo[4,5-c]quinoline of Formula V is oxidized to provide a 1H-imidazo[4,5-c]quinoline-5N-oxide of Formula VI using a conventional oxidizing agent that is capable of forming N-oxides. Preferred reaction conditions involve reacting a solution of a compound of Formula V in chloroform with 3-chloroperoxybenzoic acid at ambient conditions.

In step (5) of Reaction Scheme I a 1H-imidazo[4,5-c]quinoline-5N-oxide of Formula VI is aminated to provide a 1H-imidazo[4,5-c]quinolin-4-amine of Formula VII which is a subgenus of Formula I. Step (5) involves (i) reacting a compound of Formula VI with an acylating agent and then (ii) reacting the product with an aminating agent. Part (i) of step (5) involves reacting an N-oxide of Formula VI with an acylating agent. Suitable acylating agents include alkyl- or aryl-sulfonyl chlorides (e.g., benzenesulfonyl chloride, methanesulfonyl chloride, p-toluenesulfonyl chloride). Arylsulfonyl chlorides are preferred. Para-toluenesulfonyl chloride is most preferred. Part (ii) of step (5) involves reacting the product of part (i) with an excess of an aminating agent. Suitable aminating agents include ammonia (e.g., in the form of ammonium hydroxide) and ammonium salts (e.g., ammonium carbonate, ammonium bicarbonate, ammonium phosphate). Ammonium hydroxide is preferred. The reaction is preferably carried out by dissolving the N-oxide of Formula VI in an inert solvent such as dichloromethane, adding the aminating agent to the solution, and then slowly adding the acylating agent. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Alternatively, step (5) may be carried out by (i) reacting an N-oxide of Formula VI with an isocyanate and then (ii) hydrolyzing the resulting product. Part (i) involves reacting the N-oxide with an isocyanate wherein the isocyanato group is bonded to a carbonyl group. Preferred isocyanates include trichloroacetyl isocyanate and aroyl isocyanates such as benzoyl isocyanate. The reaction of the isocyanate with the N-oxide is carried out under substantially anhydrous conditions by adding the isocyanate to a solution of the N-oxide in an inert solvent such as chloroform or dichloromethane. Part (ii) involves hydrolysis of the product from part (i). The hydrolysis can be carried out by conventional methods such as heating in the presence of water or a lower alcohol optionally in the presence of a catalyst such as an alkali metal hydroxide or lower alkoxide.

The reaction can be carried out by adding the sodium triacetoxyborohydride to a solution of the amine and the aldehyde in an inert solvent such as dichloromethane. The secondary amine or a salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme V the secondary amine of Formula XIV is acylated to provide a compound of Formula XV which is a subgenus of Formula I. The reaction can be carried out by reacting the secondary amine of Formula XIV with an acid, acid chloride or an acid anhydride according to the methods of Reaction Schemes III, II and IV above. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (1) of Reaction Scheme VI an aminoalkyl substituted 1H-imidazo[4,5-c]quinolin-4-amine of Formula XVI is reduced to provide an aminoalkyl substituted 6,7,8,9-tetrahydro-1H-imidazo[4,5-c]quinolin-4-amine of Formula XVII. The reaction can conveniently be carried out on a Parr apparatus. The product or a salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme VI an aminoalkyl substituted 6,7,8,9-tetrahydro-1H-imidazo[4,5-c]quinolin-4-amine of Formula XVII is reacted to provide a compound of Formula XVIII which is a subgenus of Formula I. When R_3 is hydrogen, the reaction can be carried out according to the methods described in Reaction Schemes II, III and IV above using a tetrahydroimidazoquinoline of Formula XVII in place of the imidazoquinoline of Formula VIII. When R_3 is other than hydrogen, then the reaction can be carried out using the method described in Reaction Scheme V. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Tetrahydroimidazoquinolines of the invention can also be prepared according to Reaction Scheme VII where R , R_2 , R_3 , R_4 and n are as defined above and m is 1-20.

The reaction can be carried out dissolving the compound of Formula XIX in a mixture of trifluoroacetic acid and acetonitrile and stirring at ambient temperature. Alternatively, the compound of Formula XIX can be combined with dilute hydrochloric acid and heated on a steam bath. 19

method described in Reaction Scheme V. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme VII

Some compounds of Formula I can be readily prepared from other compounds of Formula I. For example, compounds wherein the R₄ substituent contains a chloroalkyl group can be reacted with an amine to provide an R₄ substituent substituted by a secondary or tertiary amino group; compounds wherein the R₄ substituent contains a nitro group can be reduced to provide a compound wherein the R₄ substituent contains a primary amine.

As used herein, the terms “alkyl”, “alkenyl”, “alkynyl” and the prefix “-alk” are inclusive of both straight chain and branched chain groups and of cyclic groups, i.e. cycloalkyl and cycloalkenyl. Unless otherwise specified, these groups contain from 1 to 20 carbon atoms, with alkenyl and alkynyl groups containing from 2 to 20 carbon atoms. Preferred groups have a total of up to 10 carbon atoms. Cyclic groups can be monocyclic or polycyclic and preferably have from 3 to 10 ring carbon atoms. Exemplary cyclic groups include cyclopropyl, cyclopentyl, cyclohexyl and adamantyl.

The term “haloalkyl” is inclusive of groups that are substituted by one or more halogen atoms, including groups wherein all of the available hydrogen atoms are replaced by halogen atoms. This is also true of groups that include the

20

prefix “haloalk-”. Examples of suitable haloalkyl groups are chloromethyl, trifluoromethyl, and the like.

The term “aryl” as used herein includes carbocyclic aromatic rings or ring systems. Examples of aryl groups include phenyl, naphthyl, biphenyl, fluorenyl and indenyl. The term “heteroaryl” includes aromatic rings or ring systems that contain at least one ring hetero atom (e.g., O, S, N). Suitable heteroaryl groups include furyl, thienyl, pyridyl, quinolinyl, isoquinolinyl, indolyl, isindolyl, pyrrolyl, tetrazolyl, imidazo, pyrazolo, oxazolo, thiazolo and so on.

“Heterocyclyl” includes non-aromatic rings or ring systems that contain at least one ring hetero atom (e.g., O, S, N). Exemplary heterocyclic groups include pyrrolidinyl, tetrahydrofuryl, morpholinyl, thiomorpholinyl, piperidinyl, piperazinyl, thiazolidinyl, and imidazolidinyl.

Unless otherwise specified, the terms “substituted aryl”, “substituted heteroaryl” and “substituted heterocyclyl” indicate that the rings or ring systems in question are further substituted by one or more substituents independently selected from the group consisting of alkyl, alkoxy, alkylthio, hydroxy, halogen, haloalkyl, haloalkylcarbonyl, haloalkoxy (e.g., trifluoromethoxy), nitro, alkylcarbonyl, alkenylcarbonyl, arylcarbonyl, heteroarylcarbonyl, aryl, arylalkyl, heteroaryl, heteroarylalkyl, heterocyclyl, heterocycloalkyl, nitrile, alkoxy carbonyl, alkanoyloxy, alkanoylthio, and, in the case of heterocyclyl, oxo.

In structural formulas representing compounds of the invention certain bonds are represented by dashed lines. These lines mean that the bonds represented by the dashed line can be present or absent. Accordingly, the compounds of the invention can be either imidazoquinoline compounds or tetrahydroimidazoquinoline compounds.

The invention is inclusive of the compounds described herein in any of their pharmaceutically acceptable forms, including isomers such as diastereomers and enantiomers, salts, solvates, polymorphs, and the like.

Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound of the invention as described supra in combination with a pharmaceutically acceptable carrier.

The term “a therapeutically effective amount” means an amount of the compound sufficient to induce a therapeutic effect, such as cytokine induction, antitumor activity and/or antiviral activity. Although the exact amount of active compound used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound as well as the nature of the carrier and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 µg/kg to about 5 mg/kg, of the compound to the subject. Any of the conventional dosage forms may be used, such as tablets, lozenges, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

The compounds of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, etc.

The compounds of the invention have been shown to induce the production of certain cytokines in experiments performed according to the tests set forth below. These results indicate that the compounds are useful as immune response

modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

Cytokines whose production may be induced by the administration of compounds according to the invention generally include interferon- α (IFN- α) and/or tumor necrosis factor- α (TNF- α) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds of the invention include IFN- α , TNF- α , IL-1, 6, 10 and 12, and a variety of other cytokines. Among other effects, cytokines inhibit virus production and tumor cell growth, making the compounds useful in the treatment of viral diseases and tumors.

In addition to the ability to induce the production of cytokines, the compounds of the invention affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine induction. The compounds may also activate macrophages, which in turn stimulates secretion of nitric oxide and the production of additional cytokines. Further, the compounds may cause proliferation and differentiation of B-lymphocytes.

Compounds of the invention also have an effect on the acquired immune response. For example, although there is not believed to be any direct effect on T cells or direct induction of T cell cytokines, the production of the T helper type 1 (Th1) cytokine IFN- γ is induced indirectly and the production of the T helper type 2 cytokines IL-4, IL-5 and IL-13 are inhibited upon administration of the compounds. This activity means that the compounds are useful in the treatment of diseases where upregulation of the Th1 response and/or downregulation of the Th2 response is desired. In view of the ability of compounds of the invention to inhibit the Th2 immune response, the compounds are expected to be useful in the treatment of atopic diseases, e.g., atopic dermatitis, asthma, allergy, allergic rhinitis; systemic lupus erythematosus; as a vaccine adjuvant for cell mediated immunity; and possibly as a treatment for recurrent fungal diseases and chlamydia.

The immune response modifying effects of the compounds make them useful in the treatment of a wide variety of conditions. Because of their ability to induce the production of cytokines such as IFN- α and/or TNF- α , the compounds are particularly useful in the treatment of viral diseases and tumors. This immunomodulating activity suggests that compounds of the invention are useful in treating diseases such as, but not limited to, viral diseases including genital warts; common warts; plantar warts; Hepatitis B; Hepatitis C; Herpes Simplex Virus Type I and Type II; molluscum contagiosum; HIV; CMV; VZV; intraepithelial neoplasias such as cervical intraepithelial neoplasia; human papillomavirus (HPV) and associated neoplasias; fungal diseases, e.g. candida, aspergillus, and cryptococcal meningitis; neoplastic diseases, e.g., basal cell carcinoma, hairy cell leukemia, Kaposi's sarcoma, renal cell carcinoma, squamous cell carcinoma, myelogenous leukemia, multiple myeloma, melanoma, non-Hodgkin's lymphoma, cutaneous T-cell lymphoma, and other cancers; parasitic diseases, e.g. *pneumocystis carinii*, cryptosporidiosis, histoplasmosis, toxoplasmosis, trypanosome infection, and leishmaniasis; and bacterial infections, e.g., tuberculosis, and *Mycobacterium avium*. Additional diseases or conditions that can be treated using the compounds of the invention include eczema; eosinophilia; essential thrombocythemia; leprosy; multiple sclerosis; Ommen's syndrome; discoid lupus; Bowen's disease; Bowenoid papulosis; and to enhance or stimulate the healing of wounds, including chronic wounds. Accordingly, the invention provides a method of inducing cytokine biosyn-

thesis in an animal comprising administering an effective amount of a compound or composition of the invention to the animal.

An amount of a compound effective to induce cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of one or more cytokines such as, for example, IFN- β , TNF- β , IL-1, 6, 10 and 12 that is increased over the background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg. The invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg. An amount of a compound effective to treat a neoplastic condition is an amount that will cause a reduction in tumor size or in the number of tumor foci. Again, the precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg.

The invention is further described by the following examples, which are provided for illustration only and are not intended to be limiting in any way.

A catalytic amount of platinum on carbon was added to a suspension of N^1 -{5-[(3-nitroquinolin-4-yl)amino]pentyl}benzamide (5 g, 13.2 mmol) in toluene (250 mL). The reaction mixture was placed under a hydrogen atmosphere at

50 psi (3.4×10^4 pascals) on a Parr apparatus. After about 2 hours an oily ball had formed in the bottom of the Parr bottle. Magnesium sulfate and additional catalyst were added and the hydrogenation was continued overnight. The reaction mixture was filtered to remove the catalyst. The residue in the Parr bottle was combined with isopropyl alcohol (150 mL), heated on a steam bath and then filtered. HPLC analysis indicated that both filtrates contained product so they were combined and concentrated under vacuum to provide crude N^1 -[5-(3-aminoquinolin-4-yl)amino]pentyl]benzamide. This material was combined with toluene (250 mL). Triethylorthoformate (4 g, 26.4 mmol) was added and the reaction mixture was heated at reflux with a Vigreux column for 2 hours. The reaction mixture was allowed to cool to ambient temperature. The resulting precipitate was isolated by filtration to provide 3.4 g of N^1 -[5-(1H-imidazo[4,5-c]quinolin-1-yl)pentyl]benzamide as a solid, m.p. 171.5-172.5°C. ^1H NMR (500 MHz, $\text{DMSO}-d_6$) δ 9.22 (s, 1H), 8.43 (t, J=6.0 Hz, 2H), 8.38 (m, 1H), 8.18 (m, 1H), 7.80 (d, J=7.0 Hz, 2H), 7.73 (m, 2H), 7.51 (t, J=7.0 Hz, 1H), 7.45 (t, J=7.0 Hz, 2H), 4.72 (t, J=7.5 Hz, 2H), 3.25 (q, J=6.0 Hz, 2H), 1.94 (quintet, J=7.5 Hz, 2H), 1.58 (quintet, J=7.5 Hz, 2H), 1.40 (quintet, J=8.5 Hz, 2H).

EXAMPLE 66

N³-[4-(4-Amino-2-phenyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]nicotinamide

Part A

A solution of benzoyl chloride (5.3 g, 37.7 mmol) in dichloromethane (100 mL) was slowly added to a solution of tert-butyl N-{4-[(3-aminoquinolin-4-yl)amino]butyl}carbamate (12.5 g, 37.7 mmol) in dichloromethane (250 mL) at ambient temperature. The reaction mixture was maintained at ambient temperature overnight. The resulting precipitate was isolated by filtration and dried to provide 11.0 g of tert-butyl N-(4-{[3-(benzoylamino)quinolin-4-yl]amino}butyl)carbamate hydrochloride as a white solid.

Part B

Triethylamine (7.26 g, 71.7 mmol) was added to a solution of the material from Part A in ethanol (200 mL) and heated at reflux for 2 days. The reaction mixture was concentrated to provide an orange syrup. HPLC mass spec analysis showed that the syrup contained the desired product and starting material. The syrup was taken up in dichloromethane (100 mL) and then cooled in an ice bath. Triethylamine (5 mL) and benzoyl chloride (1.9 mL) were added. The reaction mixture was maintained at ambient temperature for 2 days at which time analysis by HPLC indicated that the reaction was not complete. The reaction mixture was concentrated under vacuum. The residue was taken up in isopropyl alcohol (150 mL). Triethylamine (5 mL) was added and the reaction mixture was heated at reflux overnight. The reaction mixture was concentrated under vacuum. The residue was purified by flash chromatography (silica gel; eluting with 10% methanol in dichloromethane). The fractions containing product were combined and concentrated under vacuum. The residue was recrystallized from acetonitrile to provide 6.7 g of tert-butyl N-[4-(2-phenyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]carbamate as a solid, m.p. 158-159° C.

Part C

3-Chloroperoxybenzoic acid (1.05 eq of 65%) was slowly added in small portions to a solution of tert-butyl N-[4-(2-phenyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]carbamate (6.56 g, 15.75 mmol) in dichloromethane (120 mL). After 3 hours the reaction was quenched with 1% aqueous sodium bicarbonate (200 mL). The layers were separated. The aqueous layer was extracted with dichloromethane (2x50 mL). The organic fractions were combined, dried over magnesium sulfate and then concentrated under vacuum to provide a pale orange syrup. The syrup was triturated with diethyl ether to provide 6.8 g of 1-[4-(tert-butylcarbamy)butyl]-2-phenyl-1H-imidazo[4,5-c]quinoline-5N-oxide as a pale tan solid, m.p. 178-181° C.

Part D

A solution of 1-[4-(tert-butylcarbamy)butyl]-2-phenyl-1H-imidazo[4,5-c]quinoline-5N-oxide (6.8 g, 15.75 mmol) in dichloromethane (100 mL) was chilled in an ice bath. Concentrated ammonium hydroxide (30 mL) was added. Tosyl chloride (3.0 g, 15.75 mmol) was added in small portions over a period of 30 minutes. The reaction mixture was allowed to warm to ambient temperature overnight. The reaction was quenched with water (350 mL). The layers were separated. The aqueous layer was extracted with dichloromethane. The organic fractions were combined, dried over magnesium sulfate and then concentrated under vacuum to provide a tan solid. This material was purified by flash chromatography (silica gel eluting with 10% methanol in dichloromethane) to provide 4.8 g of product. The bulk of the material was carried on to the next step. A small portion was recrystallized from toluene to provide tert-butyl N-[4-(4-amino-2-phenyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]carbamate as a solid, m.p. 182-183° C. Analysis: Calculated for

$C_{25}H_{29}N_5O_2$: % C, 69.58; % H, 6.77; % N, 16.22; Found: % C, 69.86; % H, 6.95; % N, 15.80.

Part E

The material from Part D was dissolved in methanol (15 mL) and 1 N hydrochloric acid (100 mL) and then heated at reflux for 2 hours. The reaction mixture was concentrated under vacuum to a volume of about 50 mL. Addition of concentrated ammonium hydroxide to pH 12 did not produce a precipitate. The pH was adjusted to 7 with 1 N hydrochloric acid. The mixture was extracted with dichloromethane and then with ethyl acetate. The aqueous layer was concentrated to dryness. The residue was dissolved in water (50 mL) and then extracted continuously with refluxing chloroform for 36 hours. The chloroform extract was concentrated under vacuum to provide a light tan solid. This material was recrystallized from acetonitrile to provide 2.5 g of 1-(4-aminobutyl)-2-phenyl-1H-imidazo[4,5-c]quinolin-4-amine as an off white solid, m.p. 175-177° C. Analysis: Calculated for $C_{20}H_{21}N_5$: % C, 72.48; % H, 6.39; % N, 21.13; Found: % C, 72.72; % H, 6.32; % N, 20.71.

Part F

According to the general method of Example 61, 1-(4-aminobutyl)-2-phenyl-1H-imidazo[4,5-c]quinolin-4-amine and nicotinoyl chloride hydrochloride were combined to provide N^2 -[4-(4-amino-2-phenyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]nicotinamide as a white crystalline solid, m.p. 84.5-86.1° C. 1H NMR (300 MHz, DMSO- d_6) δ 8.91 (s, 1H), 8.69 (m, 1H), 8.56 (m, 1H), 8.07 (m, 2H), 7.75-7.41 (m, 8H), 7.21 (m, 1H), 6.72 (broad s, 2H), 4.60 (m, 2H), 3.15 (t, J=6.0 Hz, 2H), 1.86 (m, 2H), 1.40 (m, 2H); MS (CI) m/e 437 (M+H).

EXAMPLE 67

The compounds shown in the table below were prepared using the synthetic method described in Reaction Scheme II above.

A solution of 1-(4-aminobutyl)-1H-imidazo[4,5-c]quinolin-4-amine (36 μ mol) in 10 mL of dichloromethane in a screw-capped test tube was cooled down to -5° C. The acid chloride (45 μ mol) was added as a 0.3 M solution in dichloromethane. Argon was bubbled through the mixture during

addition and for an additional 15 seconds, and the mixture was allowed to stand at -5° C. overnight. To this mixture was added approximately 90 mg of an aminomethyl polystyrene resin (0.62 meq/g, 100-200 mesh), and the mixture was warmed to reflux and shaken at 600 rpm for 3 hours. The compounds were purified by eluting through a short plug of silica gel with 10:1 dichloromethane-methanol, collecting ca. 1 mL fractions and pooling the product fractions (fractions analyzed by tlc in 9:1 dichloromethane-methanol to identify product). Compounds were analyzed by 500 MHz 1 H nmr and APCI-MS (plug injection or an LC/MS protocol).

EXAMPLES 103-107

The compounds shown in the Table below were prepared according to the synthetic method described below.

A 10 mg (25 μmol) portion of N¹-[4-(4-amino-1H-imidazo [4,5-c]quinolin-1-yl)butyl]-4-(chloromethyl)benzamide (example 7) was dissolved in 1 mL of N,N-dimethylformamide in a screw-cap tube, and the appropriate amine (2 eq) was added, along with ca. 70 mg (270 μmol) of N,N-(diisopropyl) aminomethylpolystyrene beads (PS-DIEA, 3.86 meq/g, Argonaut). The mixture was heated to 50° C. and was vortexed overnight at 500 rpm. Another 1-2 eq of amine was added and then heating and vortexing was continued for a second night. The product was isolated by injection of the filtered reaction mixture onto a semi-prep HPLC system (Shi-

madzu LC-6A pumps, Rainin Microsorb C18 column, 21.4×250 mm, 8 micron particle size, 60 Å pore, 9.9 mL/min., gradient elution from 2-95% B in 25 min., hold at 95% B for 5 min., where A=0.1% trifluoroacetic acid/water and B=0.1% trifluoroacetic acid/acetonitrile, peak detection at 254 nm, collected 5 mL fractions). The semi-prep hplc fractions were analyzed by reversed-phase hplc and the appropriate fractions were dried in vacuo to provide the compound as a trifluoroacetate salt. The compound was dissolved in ca. 3-5 mL of 2:1 dichloromethane-methanol and shaken with ca. 80 mg (300 μmol) of diisopropylaminomethyl-polystyrene resin (Argonaut PS-DIEA, 3.86 mmol/g) for 1-2 h to liberate the free amine, and then filtered and dried in vacuo to give the compound as an amorphous solid. Each amine product was analyzed by LC/APCI-MS.

EXAMPLES 109-119

The examples in the table below were prepared using the synthetic method described in Reaction Scheme III.

1-(4-Aminobutyl)-1H-imidazo[4,5-c]quinolin-4-amine (10 mg, 0.04 mmol) was suspended in 10 mL of dichloromethane in a threaded test tube. The acid (0.05 mmol) was added and the mixture was briefly vortexed. To the mixture was added 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (EDC, 10 mg, 0.05 mmol) and the mixture was shaken overnight at ambient temperature. To the tube was added about 90 mg of aminomethylpolystyrene resin (Bachem, ~1 meq/g, 100-200 mesh) and the mixtures were

heated to reflux and shaken overnight. The mixture was then filtered to remove the resin, and was purified by semi-preparative reversed-phase HPLC (Rainin Microsorb C18 column, 21.4×250 mm, 8 micron particle size, 60 Å pore, 10 mL/min., gradient elution from 2-95% B in 25 min., hold at 95% B for 5 min., where A=0.1% trifluoroacetic acid/water

and B=0.1% trifluoroacetic acid/acetonitrile, peak detection at 254 nm for triggering fraction collection). The semi-prep HPLC fractions were analyzed by LC-APCI/MS and the appropriate fractions were combined and lyophilized to provide the trifluoroacetate salt of the desired amide. The compounds were analyzed by LC-MS (APCI).

The examples in the table below were prepared using the synthetic method described in Reaction Scheme V above.

Part A

1-(4-Aminobutyl)-1H-imidazo[4,5-c]quinolin-4-amine (25 mg, 0.1 mmol) was suspended in 5 mL of dichloromethane in a threaded test tube and the aldehyde (about 0.1 mmol) was added. The mixture was heated to reflux and was vortexed at 500 rpm for half an hour. The mixture was allowed to cool for a few minutes and then sodium triacetoxyborohydride (38 mg, 0.18 mmol) was added. The mixture was shaken at ambient temperature for 3 days, then was quenched with 0.5 mL of methanol and evaporated to dryness. The mixture was purified by semi-preparative reversed-phase HPLC (Rainin Microsorb C18 column, 21.4×250 mm, 8 micron particle size, 60 Å pore, 10 mL/min., gradient elution from 2-95% B in 25 min., hold at 95% B for 5 min., where A=0.1% trifluoroacetic acid/water and B=0.1% trifluoroacetic acid/acetonitrile, peak detection at 254 nm for triggering fraction collection). The semi-prep HPLC fractions were analyzed by LC-APCI/MS and the appropriate fractions were combined and lyophilized to provide the trifluoroacetate salt of the desired secondary amine. The compounds were analyzed by LC-MS (APCI).

The semi-prep HPLC fractions were analyzed by LC-APCI/MS and the appropriate fractions were combined and lyophilized to provide the trifluoroacetate salt of the desired secondary amine. The compounds were analyzed by LC-MS (APCI).

Part B

The secondary amines from Part A (about 3-30 μmol as the di-trifluoroacetate salt) were each dissolved in 1 mL of pyridine, and about 10 equivalents of a 0.1 M solution of acetic anhydride in dichloromethane was added. The mixtures were allowed to stand for 1 hour and then 200 μL of methanol was added. The mixtures were evaporated to dryness in a vacuum centrifuge. The mixtures were purified by semi-preparative reversed-phase HPLC as in Part A. The compounds were analyzed by LC-MS (APCI).

EXAMPLES 172-174

The examples in the table below were prepared according to the synthetic method described in Reaction Scheme VI above.

Part A

A catalytic amount of platinum (IV) oxide was added to a solution of 1-(4-aminobutyl)-2-methoxyethyl-1H-imidazo[4,5-c]quinolin-4-amine (7.7 g, 24.5 mmol) in trifluoroacetic acid (250 mL). The reaction mixture was hydrogenated at 50 psi (3.44×10⁵ Pa) on a Parr apparatus. The progress of the reaction was monitored by LC/MS. Additional catalyst was added 7, 11, and 17 days after the start of the reaction. After 25 days the reaction was complete. The reaction mixture was filtered through a layer of Celite® filter aid to remove the catalyst and the filtrate was concentrated under vacuum. The residue was combined with 1 N hydrochloric acid (100 mL) and stirred overnight. The mixture was made basic (pH=11) with ammonium hydroxide and then extracted with dichloromethane (3×300 mL). The extracts were combined and concentrated under vacuum to provide 3.5 g of 1-(4-aminobutyl)-6,7,8,9-tetrahydro-2-methoxyethyl-1H-imidazo[4,5-c]quinolin-4-amine as a solid.

Part B

Using the method of Examples DC 147-159 above. The material from Part A was reacted with the appropriate acid chloride to give the desired amide.

complete, it was quenched with aqueous 1% sodium carbonate solution. The layers were separated. The organic layer was washed with aqueous 1% sodium carbonate solution (2×100 mL). The aqueous layers were combined and then extracted with chloroform (2×30 mL). The organics were combined, dried over sodium sulfate, filtered and then concentrated under reduced pressure to provide 2.63 g of a solid. The solid was dissolved in methanol, solid sodium carbonate was added and the mixture was brought to reflux. CYTOKINE INDUCTION IN HUMAN CELLS

An in vitro human blood cell system was used to assess cytokine induction by compounds of the invention. Activity is based on the measurement of interferon and tumor necrosis factor (α) (IFN and TNF, respectively) secreted into culture media as described by Testerman et. al. In "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", Journal of Leukocyte Biology, 58, 365-372 (September, 1995).

Blood Cell Preparation for Culture

Whole blood is collected by venipuncture into EDTA vacutainer tubes from healthy human donors. Peripheral blood mononuclear cells (PBMCs) are separated from whole blood by density gradient centrifugation using Histopaque®-1077 (Sigma Chemicals, St. Louis, Mo.). The PBMCs are suspended at $3-4 \times 10^6$ cells/mL in RPMI 1640 medium containing 10% fetal bovine serum, 2 mM L-glutamine and 1% penicillin/streptomycin solution (RPMI complete). The PBMC suspension is added to 48 well flat bottom sterile tissue culture plates (Costar, Cambridge, Mass. or Becton Dickinson Labware, Lincoln Park, N.J.) containing an equal volume of RPMI complete media containing test compound.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells.

Incubation

The solution of test compound is added at 60 μ M to the first well containing RPMI complete and serial (three fold or ten fold) dilutions are made. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range. The final concentration of PBMC suspension is $1.5-2 \times 10^6$ cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37° C. in a 5% carbon dioxide atmosphere.

Separation

Following incubation the plates are centrifuged for 5-10 minutes at 1000 rpm (~200xg) at 4° C. The cell culture supernatant is removed with a sterile polypropylene pipet and transferred to sterile polypropylene tubes. Samples are maintained at -30 to -70° C. until analysis. The samples are analyzed for interferon (α) by either ELISA or bioassay and for tumor necrosis factor (α) by ELISA.

Interferon Bioassay Analysis

Interferon is determined by bioassay using A549 human lung carcinoma cells challenged with encephalomyocarditis. The details of the bioassay method have been described by G. L. Brennan and L. H. Kronenberg in "Automated Bioassay of Interferons in Micro-test Plates", Biotechniques, June/July, 78, 1983, incorporated herein by reference. Briefly stated the method is as follows: A549 cells are incubated with dilutions of samples or a standard interferon at 37° C. for 24 hours. The incubated cells are then infected with an inoculum of encephalomyocarditis virus. The infected cells are incubated for an additional 24 hours at 37° C. before evaluating for viral cytopathic effect. The viral cytopathic effect is quantified by staining with crystal violet followed by visual scoring of the plates. Results are expressed as alpha reference units/mL based on the value obtained for NIH Human Leukocyte IFN standard.

Interferon (α) and Tumor Necrosis Factor (α) Analysis by ELISA

Interferon (α) concentration is determined by ELISA using a Human Multi-Species kit from PBL Biomedical Laboratories, New Brunswick, N.J.

Tumor necrosis factor (α) (TNF) concentration is determined using ELISA kits available from Genzyme, Cambridge, Mass.; R&D Systems, Minneapolis, Minn.; or Pharmingen, San Diego, Calif.

The table below lists the lowest concentration found to induce interferon and the lowest concentration found to induce tumor necrosis factor for each compound. A "****"

indicates that no induction was seen at any of the tested concentrations (0.12, 0.37, 1.11, 3.33, 10 and 30 μ M). A "****" indicates that no induction was seen at any of the tested concentrations (0.0001, 0.001, 0.01, 0.1, 1 and 10 μ M). Unless otherwise indicated, the interferon biosynthesis was determined by ELISA.

*Interferon determined using the bioassay method

The present invention has been described with reference to several embodiments thereof. The foregoing detailed description and examples have been provided for clarity of understanding only, and no unnecessary limitations are to be understood therefrom. It will be apparent to those skilled in the art that many changes can be made to the described embodiments without departing from the spirit and scope of the invention. Thus, the scope of the invention should not be limited to the exact details of the compositions and structures described herein, but rather by the language of the claims that follow.

What is claimed is:

1. A compound of the formula (Ie):

wherein

R₁ is —C₂₋₄ alkyl—NR₃—CO—R₄;R₂ is selected from the group consisting of hydrogen, C₁₋₄ alkyl, and C₁₋₄ alkyl—O—C₁₋₄ alkyl;R₃ is hydrogen;R₄ is C₁₋₈ alkyl; and

n is 0;

or a pharmaceutically acceptable salt thereof.

2. The compound or salt of claim 1 wherein R₂ is C₁₋₄ alkyl—O—C₁₋₄ alkyl, and R₄ is cyclohexyl.

3. A pharmaceutical composition comprising a therapeutically effective amount of a compound of claim 1 in combination with a pharmaceutically acceptable carrier.

4. A pharmaceutical composition comprising a therapeutically effective amount of a compound of claim 2 in combination with a pharmaceutically acceptable carrier.
