(A)

PYRIDINE DERIVATIVES AS S1P1/EDG1 RECEPTOR MODULATORS

FIELD OF THE INVENTION

[0001] The present invention relates to S1P1/EDG1 receptor agonists of Formula (I) and their use as active ingredients in the preparation of pharmaceutical compositions. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing a compound of the Formula (I), and their use as compounds improving vascular function and as immunomodulating agents, either alone or in combination with other active compounds or therapies.

BACKGROUND OF THE INVENTION

[0002] The human immune system is designed to defend the body against foreign micro-organisms and substances that cause infection or disease. Complex regulatory mechanisms ensure that the immune response is targeted against the intruding substance or organism and not against the host. In some cases, these control mechanisms are unregulated and autoimmune responses can develop. A consequence of the uncontrolled inflammatory response is severe organ, cell, tissue or joint damage. With current treatment, the whole immune system is usually suppressed and the body's ability to react to infections is also severely compromised. Typical drugs in this class include azathioprine, chlorambucil, cyclophosphamide, cyclosporin, or methotrexate. Corticosteroids which reduce inflammation and suppress the immune response, may cause side effects when used in long term treatment. Nonsteroidal anti-inflammatory drugs (NSAIDs) can reduce pain and inflammation, however, they exhibit considerable side effects. Alternative treatments include agents that activate or block cytokine signaling.

[0003] Orally active compounds with immunomodulating properties, without compromising immune responses and with reduced side effects would significantly improve current treatments of uncontrolled inflammatory disease.

[0004] In the field of organ transplantation the host immune response must be suppressed to prevent organ rejection. Organ transplant recipients can experience some rejection even when they are taking immunosuppressive drugs. Rejection occurs most frequently in the first few weeks after transplantation, but rejection episodes can also happen months or even years after transplantation. Combinations of up to three or four medications are commonly used to give maximum protection against rejection while minimizing side effects. Current standard drugs used to treat the rejection of transplanted organs interfere with discrete intracellular pathways in the activation of T-type or B-type white blood cells. Examples of such drugs are cyclosporin, daclizumab, basiliximab, everolimus, or FK506, which interfere with cytokine release or signaling; azathioprine or leflunomide, which inhibit nucleotide synthesis; or 15-deoxyspergualin, an inhibitor of leukocyte differentiation.

[0005] The beneficial effects of broad immunosuppressive therapies relate to their effects; however, the generalized immunosuppression which these drugs produce diminishes the immune system's defense against infection and malignan-

cies. Furthermore, standard immunosuppressive drugs are often used at high dosages and can cause or accelerate organ damage.

DESCRIPTION OF THE INVENTION

[0006] The present invention provides novel compounds of Formula (I) that are agonists for the G protein-coupled receptor S1P1/EDG1 and have a powerful and long-lasting immunomodulating effect which is achieved by reducing the number of circulating and infiltrating T- and B-lymphocytes, without affecting their maturation, memory, or expansion. The reduction of circulating T-/B-lymphocytes as a result of S1P1/EDG1 agonism, possibly in combination with the observed improvement of endothelial cell layer function associated with S1P1/EDG1 activation, makes such compounds useful to treat uncontrolled inflammatory disease and to improve vascular functionality.

[0007] The compounds of the present invention can be utilized alone or in combination with standard drugs inhibiting T-cell activation, to provide a new immunomodulating therapy with a reduced propensity for infections when compared to standard immunosuppressive therapy. Furthermore, the compounds of the present invention can be used in combination with reduced dosages of traditional immunosuppressant therapies, to provide on the one hand effective immunomodulating activity, while on the other hand reducing end organ damage associated with higher doses of standard immunosuppressive drugs. The observation of improved endothelial cell layer function associated with S1P1/EDG1 activation provides additional benefits of compounds to improve vascular function.

[0008] The nucleotide sequence and the amino acid sequence for the human S1P1/EDG1 receptor are known in the art and are published in e.g.: Hla, T., and Maciag, T. *J. Biol. Chem.* 265 (1990), 9308-9313; WO 91/15583 published 17 Oct. 1991; WO 99/46277 published 16 Sep. 1999. The potency and efficacy of the compounds of Formula (I) are assessed using a GTPγS assay to determine EC₅₀ values and by measuring the circulating lymphocytes in the rat after oral administration, respectively (see in Examples).

Structure 5

[0191] A compound of Structure 4 may be prepared from a compound of Structure 5. Methods that effect the transformation of a compound of Structure 4 into a compound of Structure 5, or the opposite, are known to a person skilled in the art.

Structure 6

Structure 7

[0192] Compounds of Formula (I) which represent a [1,3,4]oxadiazole or [1,3,4]thiadiazole derivative are prepared similarly by reacting a compound of Structure 2 with hydrazine (by using a coupling reagent such as TBTU, DCC, EDC, HBTU, PyBOP, HOBt, CDI, etc.) to form a compound of Structure 6 which is then coupled with a compound of Structure 5 to give a compound of Structure 7. A compound of Structure 7 can also be prepared by following the reverse reaction order i.e. by first coupling a compound of Structure 5 with hydrazine followed by reacting the corresponding hydrazide intermediate with a compound of Structure 2. Dehydration of a compound of Structure 7 to form the desired [1,3,4]oxadiazole derivative is affected by treating a compound of Structure 7 with a reagent such as POCl₃, CCl₄ or

CBr_4 in combination with triphenylphosphine, P_2O_5 , Burgess reagent, etc. in a solvent such as toluene, acetonitrile, dioxane, THF, CHCl_3 , etc. at temperatures between 20 and 120° C. in the presence or absence of microwave irradiation. (Lit.: e.g. M. A. García, S. Martín-Santamaria, M. Cacho, F. Moreno de la Llave, M. Julian, A. Martínez, B. De Pascual-Teresa, A. Ramos, *J. Med. Chem.* 48 (2005) 4068-4075; C. T. Brain, J. M. Paul, Y. Loong, P. J. Oakley, *Tetrahedron Lett.* 40 (1999) 3275-3278). Likewise, [1,3,4]thiadiazole derivatives are obtained by cyclising a compound of Structure 7 with Lawesson's reagent optionally in combination with P_2S_5 in the presence or absence of a solvent such as pyridine, toluene, THF, acetonitrile, etc. at elevated temperatures with or without microwave irradiation (Lit.: e.g. A. A. Kiryanov, P. Sampson, A. J. Seed, *J. Org. Chem.* 66 (2001) 7925-7929; *Org. Prep. Proc. Int.* 37 (2005) 213-222).

Structure 8

[0193] Compounds of Formula (I) which represent an oxazole or a thiazole derivative are prepared by treating a compound of Structure 8 either with POCl_3 , PCl_5 , I_2 in combination with triphenylphosphine and triethylamine, trifluoroacetic anhydride, Burgess reagent, etc. in a solvent such as toluene, benzene, dioxane, THF, etc. at temperatures between 20 and 120° C., or with Lawesson's reagent, optionally in combination with P_2S_5 , in the presence or absence of a solvent such as pyridine, toluene, THF, acetonitrile, etc. at elevated temperatures with or without microwave irradiation as mentioned above (Lit.: e.g. N. Sato, T. Shibata, M. Jitsuoka, T. Ohno, T. Takahashi, T. Hirohashi, T. Kanno, H. Iwaasa, A. Kanatani, T. Fukami, *Bioorg. & Med. Chem. Lett.* 14 (2004) 1761-1764). The compounds of Structure 8 are prepared by reacting a compound of Structure 9 with a compound of Structure 5. The aminoketone of Structure 9 can be prepared from a compound of Structure 2 by procedures given in the literature (e.g. J. L. LaMattina, *J. Heterocyclic Chem.* 20 (1983) 533-538; M. Pesson, M. Antoine, P. Girard, J. L. Benichon, S. Chabassier, P. De Lajudie, S. Patte, F. Roquet, G. Montay, *Eur. J. Med. Chem.* 15 (1980) 263-268).

Structure 9

[0194] Alternatively, the bonds between the pyridine or the phenylring and the central 5-membered heteroaromatic ring can also be formed by applying palladium catalysed cross coupling reactions.

[0195] Depending on the nature of the functionalities present in the residues R^1 , R^3 , R^5 , R^6 , R^{11} , R^{13} , R^{15} , and R^{16} , these functionalities may require temporary protection.

[0196] Appropriate protecting groups are known to a person skilled in the art and include e.g. a benzyl, a THP or a trialkylsilyl group to protect an alcohol, or a BOO group to protect an amine, etc. These protecting groups may be

employed according to standard methodology (e.g. T. W. Greene, P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd Edition, Wiley New York, 1991; P. J. Kocienski, *Protecting Groups*, Thieme Stuttgart, 1994).

[0197] Compounds of Structure 2, wherein Pyridine¹ represents

may be prepared by reacting a 2,6-dichloro-isonicotinic acid ester (Structure 10, below) with an alkyl Grignard reagent in the presence of $\text{Fe}(\text{acac})_3$ in a solvent such as THF, dioxane, DMF, NMP, etc., or combinations thereof, at temperatures ranging from -78 to 25° C. (Fürstner conditions, Lit.: e.g. A. Fürstner, A. Leitner, M. Mendez, H. Krause *J. Am. Chem. Soc.* 124 (2002) 13856-13863; A. Fürstner, A. Leitner, *Angew. Chem.* 114 (2002) 632-635). The reaction conditions can be chosen such that either the 2-chloro-6-alkyl-isonicotinic acid ester or the 2,6-dialkyl-isonicotinic acid ester is obtained as the main product. The two chlorine atoms in a 2,6-dichloro-isonicotinic acid ester may also be substituted either sequentially or in one step by two alk-1-enyl groups, which may be the same or different, by treating 2,6-dichloro-isonicotinic acid ester with the appropriate alkenyl boron derivative under Suzuki coupling conditions known to a person skilled in the art. The obtained 2,6-di-alkenyl-isonicotinic acid ester is hydrogenated to the corresponding 2,6-dialkyl-isonicotinic acid ester. In addition, a procedure in which the Fürstner and the Suzuki conditions are employed sequentially can be envisaged. The 2,6-dichloro-isonicotinic acid esters or the 2-chloro-6-alkyl-isonicotinic acid esters may also be treated with an alcohol or an alcoholate at elevated temperatures to furnish the corresponding 2-chloro-6-alkoxy-isonicotinic acid esters or 2-alkoxy-6-alkyl-isonicotinic acid esters (Lit.: e.g. N. Wild, U. Groth, *Eur. J. Org. Chem.* 2003, 4445-4449). Finally, cleavage of the ester functionality delivers the compounds of Structure 2.

Structure 10

Structure 11

-continued

Structure 12

[0198] Compounds of the above Structure 2 wherein R^1 represents $NR^{1a}R^{1b}$ may be prepared by reacting a 2,6-dichloro-isonicotinic acid ester (Structure 10, wherein R represents a C_{1-4} -alkyl, preferably an isopropyl or a tert.-butyl group) with the appropriate amine $NHR^{1a}R^{1b}$ in the presence or absence of an additional solvent such as THF, dioxane, ethanol, etc., preferably at temperatures above 50°C . to give a compound of Structure 11. The compounds of Structure 11 can then be reacted with the appropriate alkyl-Zn reagent (e.g. Me_2Zn , MeZnCl , Et_2Zn , etc.) under Negishi reaction conditions (Lit.: e.g. H. Matsushita, E. Negishi, *J. Org. Chem.* 47 (1982) 4161-4165) to give a compound of Structure 12, which can be hydrolysed to a compound of Structure 2. In addition, compounds of the Structure 12 may be prepared by reacting a compound of Structure 11 with an alkyl Grignard reagent in the presence of $\text{Fe}(\text{acac})_3$ in a solvent such as THF, dioxane, DMF, NMP, etc., or combinations thereof, at temperatures ranging from -78 to 25°C . (Füstner conditions, see above). In case R^2 represents a C_{2-4} -alkyl group, the corresponding compounds of Structure 12 can also be prepared by reacting a compound of Structure 11 with an alkenyl boron derivative (e.g. 2,4,6-trivinyl-cyclotriboroxane) under Suzuki conditions (Lit.: e.g. F. Kerins, D. F. O'Shea, *J. Org. Chem.* 67 (2002) 4968-4971). The obtained 2-amino-6-alkenyl-isonicotinic acid derivative is hydrogenated to the corresponding compound of Structure 12.

[0199] Compounds of Structure 2, wherein R^2 represents a methoxy group can be prepared in analogy to the pathway outlined above from commercially available 2-chloro-6-methoxy-pyridine-4-carboxylic acid by introducing the desired C_{1-5} -alkyl or C_{3-6} -cycloalkyl residue for R^1 under either Negishi, Füstner or Suzuki conditions.

Structure 13

[0200] Alternatively, the compounds of Structure 12 may also be prepared by reacting a compound of Structure 13 with the appropriate amine $NHR^{1a}R^{1b}$ under Buchwald-Hartwig conditions (Lit.: e.g. J. P. Wolfe, H. Tomori, J. P. Sadighi, J. Yin, S. L. Buchwald, *J. Org. Chem.* 65 (2000) 1158-1174; S. Wagaw, S. L. Buchwald, *J. Org. Chem.* 61 (1996) 7240-7241; M. C. Harris, O. Geis, S. L. Buchwald, *J. Org. Chem.* 64 (1999) 6019-6022; S. R. Stauffer, S. Lee, J. P. Stambuli, S. I.

Hauck, J. F. Hartwig, *Org. Letters* 2 (2000) 1423-1426). Compounds of Structure 13 or their corresponding acids are either commercially available or may be prepared by reacting a 2,6-dichloro-isonicotinic acid ester (Structure 10) with an alkyl Grignard reagent under Füstner conditions (see above) or with an alkyl-Zn reagent under Negishi conditions. Reacting a compound of Structure 10 with an alkenyl boron derivative under Suzuki conditions, treating the corresponding alkenyl-chloro-isonicotinic acid ester with an amine $NHR^{1a}R^{1b}$ under Buchwald-Hartwig conditions and subsequent hydrogenation may also give access to compounds of Structure 12. The residues R^{1a} and R^{1b} may also be introduced by sequential alkylation and/or reductive amination of a compound of Structure 14 (Lit.: e.g. N. Finch, T. R. Campbell, C. W. Gemenden, H. J. Povalski, *J. Med. Chem.* 23 (1980) 1405-1410) which may be prepared by reacting a compound of Structure 13 with ammonia in a solvent such as water, methanol, ethanol, THF, etc. at elevated temperatures.

Structure 14

Structure 15

[0201] In case R^{1b} represents hydrogen, the corresponding pyridine derivatives that may occur in the course of the synthesis of compounds of Formula (I), may require temporary protection at the secondary amine function.

[0202] Compounds of Structure 2 and Structure 5 that represent an isonicotinic acid wherein R^1 and R^{11} represent hydroxymethyl, respectively, may be prepared from a corresponding 2-alkyl-isonicotinic acid ester (e.g. methyl ester) using the Minisci reaction (Lit.: e.g. R. B. Katz, J. Mistry, M. B. Mitchell, *Synth. Commun.* 19 (1989) 317-325; M. A. A. Biyouki, R. A. J. Smith, J. J. Bedford, J. P. Leader, *Synth. Commun.* 28 (1998) 3817-3825). Compounds of Structure 2 and 5 wherein R^2 and R^{12} represent a methyl group and R^1 and R^{11} represent hydroxymethyl, respectively, may also be prepared by making use of the Boeckelheide reaction (Lit.: e.g. N. C. Habermehl, P. M. Angus, M. L. Kilah, L. Noren, A. D. Rae, A. C. Willis, S. B. Wild, *Inorg. Chem.* 45 (2006) 1445-1462).

[0203] The above described reaction sequences that allow the introduction of the two residues R^1 and R^2 may also be applied to a compound in which the scaffold has already been further elaborated. For instance, the Buchwald reaction may also be applied to a compound of Structure 15.

[0204] Compounds of the Structure 2 wherein Pyridine¹ represents

may be prepared by reacting a 5,6-dichloronicotinic acid ester with an alkyl Grignard reagent in the presence of Fe(acac)₃ in a solvent such as THF, dioxane, DMF, NMP, etc., or combinations thereof, at temperatures ranging from -78 to 25° C. (Fürstner conditions, Lit.: e.g. A. Fürstner, A. Leitner, M. Mendez, H. Krause, *J. Am. Chem. Soc.* 124 (2002) 13856-13863; A. Fürstner, A. Leitner, *Angew. Chem.* 114 (2002) 632-635). The reaction conditions can be chosen such that either the 5-chloro-6-alkyl-nicotinic acid ester or the 5,6-dialkyl-nicotinic acid ester is obtained as the main product. The two chlorine atoms in a 5,6-dichloronicotinic acid ester may also be substituted either sequentially or in one step by two alk-1-enyl groups, which may be the same or different, by treating 5,6-dichloronicotinic acid ester with the appropriate alkenyl boron derivative under Suzuki coupling conditions known to a person skilled in the art. The obtained 5,6-dialkenyl-nicotinic acid ester is hydrogenated to the corresponding 5,6-dialkyl-nicotinic acid ester. In addition, a procedure in which the Fürstner and the Suzuki conditions are employed sequentially can be envisaged. Furthermore, chloronicotinic acids may also be transformed to the corresponding alkylnicotinic acid using the Negishi reaction (see above). The 5,6-dichloronicotinic acid ester may also be treated with an alcohol or an alcoholate at elevated temperatures to furnish the corresponding 5-chloro-6-alkoxy-nicotinic acid esters. Finally, cleavage of the ester functionality delivers the compounds of Structure 2.

[0205] Alternatively, compounds of Structure 2, wherein R⁴ represents a methyl group, can be prepared from a compound of Structure 16 via formation of the corresponding 6-chloro-5-methyl-nicotinic acid esters using methods well known in the art, followed by derivatisation using Fürstner or Suzuki conditions as described above and subsequent cleavage of the ester function. The compound of Structure 16 can be prepared from known 6-chloro-3-formyl-5-methyl-pyridine (Lit.: e.g. EP-0702003 or as described herein) by oxidation of the formyl group to the carboxylic acid using oxidation reagents well known in the art such as aq. H₂O₂ in formic acid, KMnO₄, etc. in the presence or absence of a solvent such as toluene, THF, acetonitrile, acetone, etc. at temperatures between 0 and 120° C. The corresponding nitrile of Structure 4, wherein R¹² represents a methyl group, can be prepared according to literature methods (Lit.: e.g. J. B. Paine III, *J. Heterocyclic Chem.* 1987, 351-355).

Structure 16

[0206] Compounds of Structure 5 are prepared in an analogous fashion.

[0207] Compounds of Structure 2 wherein Pyridine¹ represents

[0208] (Structure 17) may be prepared following the reaction sequence outlined below:

Structure 17

[0209] The picolinic acid of Structure 17 may be prepared by treating a compound of Structure 18 (either commercially available or prepared in analogy to literature procedures e.g. T. Kaminski, P. Gros, Y. Fort, *Eur. J. Org. Chem.* 19 (2003) 3855-3860; U. Ziener, E. Breuning, J.-M. Lehn, E. Wegelius, K. Rissanen, G. Baum, D. Fenske, G. Vaughan, *Chemistry-A European Journal* 6 (2000) 4132-4139; R.-A. Fallahpour, *Synthesis* 2000 1665-1667) with 2,4,6-trivinyl-cyclotri-boroxane under Suzuki conditions to form a compound of Structure 19 which is oxidised and esterified to the picolinic acid of Structure 20. Oxidation of a commercially available compound of Structure 21 may also give access to a compound of Structure 20. The compound of Structure 20 is then either subjected to Suzuki cross coupling conditions using the appropriate 2,4,6-trialkenyl-cyclotri-boroxane (prepared according to F. Kerins, D. F. O'Shea, *J. Org. Chem.* 67 (2002) 4968-4971), hydrogenated and saponified, or treated with the appropriate alkyl-Zn-reagent under Negishi conditions prior to saponification to furnish the desired compound of Structure 17.

Suzuki reaction with the appropriate 2,4,6-trialkenyl-cyclotri-boroxane, hydrogenation and saponification or Negishi reaction with the appropriate alkyl-Zn-reagent followed by saponification of a compound of Structure 26 furnish the compounds of Structure 22.

- 1) esterification
- 2) Suzuki reaction with 2,4,6-trialkenyl-cyclotri-boroxane
- 3) hydrogenation
- 4) saponification or
- 2) Negishi reaction with e.g. R⁷ZnCl
- 3) saponification

[0213] Analogously, by applying the reaction sequence of either esterification, Suzuki reaction, hydrogenation, saponification or esterification, Negishi reaction and saponification, a commercially available compound of Structure 28 may be transformed into a compound of Structure 27.

[0214] Compounds of Structure 2 wherein Pyridine¹ represents

[0215] (Structure 33) may be prepared following the reaction sequence outlined below:

[0216] Thus, a compound of Structure 29 is treated with 2,4,6-trivinyl-cyclotri-boroxane under Suzuki conditions to give a compound of Structure 30. Oxidation followed by saponification gives the corresponding compound of Structure 31. Suzuki reaction with the appropriate 2,4,6-trialkenyl-cyclotri-boroxane, hydrogenation and saponification or Negishi reaction with the appropriate alkyl-Zn-reagent followed by saponification furnishes the desired compounds of Structure 33. Compounds of Structure 29, wherein R^{10} represents a methyl group are commercially available. Compounds of Structure 29, wherein R^{10} represents an ethyl group can be prepared following literature procedures (e.g. T. Hanazawa, M. Hirano, T. Inoue, K. Nakao, Y. Shishido, H. Tanaka; WO 2006/097817 (Pfizer Japan Inc.), p 84; S. R. Natarajan et al. *Bioorg. Med. Chem. Lett.* 13 (2003) 273-276),

for instance from commercially available 3-amino-2,6-dichloropyridine as outlined below:

[0217] In general, the desired residues R^1 to R^{20} may also be introduced in later steps that follow establishing of the Pyridine¹-A-Pyridine² scaffold.

[0218] Whenever the compounds of Formula (I) are obtained in the form of mixtures of enantiomers, the enantiomers can be separated using methods known to one skilled in the art: e.g. by formation and separation of diastereomeric salts or by HPLC over a chiral stationary phase such as a Regis Whelk-O1(R,R) (10 μ m) column, a Daicel ChiralCel OD-H (5-10 μ m) column, or a Daicel ChiralPak IA (10 μ m) or AD-H (5 μ m) column. Typical conditions of chiral HPLC are an isocratic mixture of eluent A (EtOH, in presence or absence of an amine such as triethylamine, diethylamine) and eluent B (hexane), at a flow rate of 0.8 to 150 mL/min.

GTP γ S Assay to Determine EC_{50} Values

[0654] GTP γ S binding assays are performed in 96 well microtiter plates (Nunc, 442587) in a final volume of 200 μL , using membrane preparations of CHO cells expressing recombinant human S1P1 receptor. Assay conditions are 20 mM Hepes (Fluka, 54461), 100 mM NaCl (Fluka, 71378), 5 mM MgCl_2 (Fluka, 63064), 0.1% BSA (Calbiochem, 126609), 1 μM GDP (Sigma, G-7127), 2.5% DMSO (Fluka, 41644), 50 μM ^{35}S -GTP γ S (Amersham Biosciences, SJ1320). The pH is 7.4. Test compounds are dissolved and diluted in 100% DMSO and pre-incubated at room temperature for 30 min in 150 μL of the above assay buffer, in the absence of ^{35}S -GTP γ S. After addition of 50 μL of ^{35}S -GTP γ S, the assay is incubated for 1 h at rt. The assay is terminated by transfer of the reaction mixture to a Multiscreen plate (Millipore, MAHFC1H60) using a cell harvester from Packard Biosciences, and the plates are washed with ice-cold 10 mM

Na₂HPO₄/NaH₂PO₄ (70%/30%), dried, sealed at the bottom and, after addition of 25 µl MicroScint20 (Packard Biosciences, order#6013621), sealed on the top. Membrane-bound ³⁵S-GTPγS is measured with a TopCount from Packard Biosciences.

[0655] EC₅₀ is the concentration of agonist inducing 50% of the maximal specific ³⁵S-GTPγS binding. Specific binding is determined by subtracting non-specific binding from maximal binding. Maximal binding is the amount of cpm bound to the Multiscreen plate in the presence of 10 µM of S1P. Non-specific binding is the amount of binding in the absence of an agonist in the assay.

[0656] Agonistic activities (EC₅₀ values) of all exemplified compounds are in the range of 0.3-4250 nM with an average of 406 nM. Agonistic activities, determined according to the method described above, of some compounds of Formula (I) are displayed in Table 1:

Assessment of In Vivo Efficacy

[0657] The efficacy of the compounds of Formula (I) is assessed by measuring the circulating lymphocytes after oral administration of 3 to 30 mg/kg of a compound of Formula (I) to normotensive male Wistar rats. The animals are housed in climate-controlled conditions with a 12 h-light/dark cycle, and have free access to normal rat chow and drinking water. Blood is collected before and 3, 6 and 24 h after drug administration. Full blood is subjected to hematology using Advia Hematology system (Bayer Diagnostics, Zürich, Switzerland).

[0658] All data are presented as mean±SEM. Statistical analyses are performed by analysis of variance (ANOVA) using Statistica (StatSoft) and the Student-Newman-Keuls procedure for multiple comparisons. The null hypothesis is rejected when p≤0.05.

[0659] As an example, Table 2 shows the effect on lymphocyte counts 6 h after oral administration of 10 mg/kg, or where indicated of 3 mg/kg, of some compounds of the present invention to normotensive male Wistar rats as compared to a group of animals treated with vehicle only.
