MEDICINE FOR INHIBITING DRUG ELIMINATION PUMP

TECHNICAL FIELD

[0001] The present invention relates to a medicament useful for preventive and therapeutic treatment of microbial infectious diseases.

BACKGROUND ART

[0002] For preventive or therapeutic treatment of infectious diseases caused by microorganisms, various antibacterial agents have so far been developed, and drugs such as β -lactam antibiotics (penicillins, cephems, monobactams, carbapenems, and penems), aminoglycosides, quinolones, macrolides, tetracyclines, rifamycins, chloramphenicols, and phosphomycins have been practically used. However, with the increase of clinically used amount of antibacterial agents, remarkable numbers of resistant bacterial strains to these antibacterial agents have emerged, which becomes a serious problem in the treatment of infectious diseases.

[0003] Examples of problematic bacteria, which cause particularly intractable or serious infectious diseases among those caused by resistant bacteria, include *Pseudomonas aeruginosa* and methicillin-resistant *Staphylococcus aureus* (MRSA). Antibacterial agents effective against these bacteria have been limited so far, and it is not certain whether or not therapeutic efficacy of the currently available drugs will be expected in the future. In particular, no drug is available at present by which specifically high efficacy against resistant *Pseudomonas aeruginosa* can be achieved. With the increase of aged population and the popularization of sophisticated medical technologies including human organ transplantation and anti-cancer treatments, infections frequently occurring particularly in patients with reduced immunity, i.e., so-called opportunistic infections, have become an extremely serious problem in the clinical field, and under the circumstances, early developments of measures against the resistant bacteria are desired.

[0004] Recently, the presence of drug efflux pumps has recognized as a bacterial excretion mechanism of drugs through researches on resistance acquiring mechanisms of resistant bacteria. In earlier researches, a pump that specifically excretes a tetracycline antibacterial agent from bacterial cells was identified in 1980 by the group of Levy, and the discovery was noted as a major factor of the resistance to tetracycline (L. McMurry, Proc. Natl. Acad. Sci. U.S.A., 77, 3974, 1980). Furthermore, based on recent researches, the presence of multidrug-excreting drug efflux pumps was reported in *Escherichia coli*, *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Staphylococcus* bacteria, *Diplococcus pneumoniae*, and *Neisseria gonorrhoeae*. Four multidrug efflux pumps have so far been reported as homologous drug efflux pumps deriving from *Pseudomonas aeruginosa*, and they have been considered as a cause of low drug sensitivity inherent to *Pseudomonas aeruginosa* (K. Poole et al., J. Bacteriol., 175, 7363, 1993; K. Poole et al., M. Microbiol., 21, 713, 1996; T. Kohler et al., M. Microbiol., 23, 345, 1997; T. Mine et al., Antimicrob. Agents Chemother., 43, 415, 1999).

[0005] The drug efflux pumps of *Pseudomonas aeruginosa* excrete various drugs including β -lactams, tetracy-

clines, chloramphenicols, and quinolones, to which the drug resistance of *Pseudomonas aeruginosa* is attributable.

[0006] In order to overcome the problem, it will be effective to invent an antibacterial agent that has a novel structure, by which resistance acquisition due to a drug efflux pump, one of factors of resistance acquisition, can be avoided, or develop an agent for a combinational use with currently available antibacterial agents that can restore their efficacy by inhibiting functions of drug efflux pumps. As one of the latter means, drug efflux pump inhibitors have been known (WO 01/30757).

[0007] Under the circumstances, if information as to whether or not an etiologic bacterium expresses a drug efflux pump or information as to what kind of drug efflux pump is expressed by the microorganism can be obtained in a convenient manner, it is believed that more effective chemotherapy will become possible. For example, when a drug efflux pump inhibitor is used in combination which restores efficacy of an existing antibacterial agent by inhibiting the function of drug efflux pump, it is expected that judgment of appropriateness of application of a drug efflux pump inhibitor as well as selection of combinational therapy utilizing an inhibitor effective to a particular drug efflux pump and an antibacterial agent can be made by obtaining the aforementioned information. However, any method to conveniently obtain the aforementioned information has not been known so far. In particular, any means to conveniently identify a kind of drug efflux pump expressed in a microorganism or any means to conveniently know whether or not two or more kinds of drug efflux pumps are expressed in a microorganism has not yet been known to date.

DISCLOSURE OF THE INVENTION

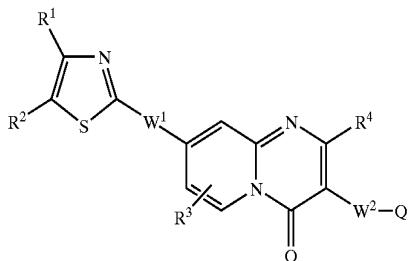

[0008] Therefore, an object of the present invention is to provide a novel medicament for the treatment of infectious diseases that improves therapeutic efficacy of an agent against pathogenic microorganisms, in particular, a medicament that acts on a microorganism with acquired resistance to an antimicrobial agent, and eliminates the resistance of the bacteria by inhibiting a drug efflux pump so as to improve preventive and/or therapeutic effect of the antimicrobial agent.

[0009] Another object of the present invention is to provide a method for judging effectiveness of a drug efflux pump inhibitor against a microorganism. A still further object of the present invention is to provide a method for conveniently obtaining information on what kind of drug efflux pump is expressed by a microorganism. More specifically, the object is to provide a method for identifying a drug efflux pump expressed in a microorganism, and a method for conveniently verifying expression of two or more kinds of drug efflux pumps in a microorganism.

[0010] In order to achieve the aforementioned first object, the inventors of the present invention conducted various researches to search for compounds that eliminate resistance to an antimicrobial drug of *Pseudomonas aeruginosa* that has acquired the resistance. As a result, they found that the compounds represented by the following general formula (I) or (II) had the desired activity, and thus achieved the present invention.

[0011] The present invention thus provides a medicament for preventive and/or therapeutic treatment of microbial

infections, which comprises as an active ingredient a compound represented by the following general formula (I) or a physiologically acceptable salt thereof, or a hydrate thereof:

[0012] wherein,

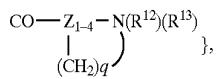

[0013] R¹ and R² each independently represent hydrogen atom, a halogen atom, hydroxyl group, a group of OZ₁₋₆ (the group of OZ₁₋₆ represents an alkyl group having 1-6 carbon atoms or a fluoroalkyl group having 1-6 carbon atoms, which bonds via the oxygen atom), a group of S(O)_nZ₁₋₄ (Z₁₋₄ represents an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms or an alkylene group derived therefrom), a group of N(R¹²)(R¹³) (R¹² and R¹³ each independently represent hydrogen atom, an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms), a group of Z₁₋₈ which may be substituted (Z₁₋₈ represents an alkyl group having 1-8 carbon atoms or a fluoroalkyl group having 1-8 carbon atoms), a 5- to 7-membered cyclic alkyl group, an aryl group, a heteroaryl group, or a 4- to 7-membered saturated or partially saturated heterocyclic group (the cyclic alkyl group, aryl group, heteroaryl group and heterocyclic group may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OZ₁₋₄, a group of S(O)_nZ₁₋₄, a group of N(R¹²)(R¹³), a group of Z₁₋₄, carboxyl group, a group of CO₂Z₁₋₄, group of CONH₂, a group of CONH(Z₁₋₄) and a group of CON(Z₁₋₄)(Z₁₋₄));

[0014] W¹ represents a group selected from the group consisting of —CH=CH—, —N(R¹²)CO—, —CON(R¹²)—, —CH₂O— and —CH₂CH₂— (each of the aforementioned groups binds to the thiazole ring at the left end);

[0015] R³ represents hydrogen atom, a halogen atom, hydroxyl group or an amino group;

[0016] R⁴ represents a group selected from the group consisting of hydrogen atom, a group of —OZ₀₋₄R⁵ (Z₀₋₄ represents an alkylene group having 1-4 carbon atoms, a fluorine-substituted alkylene group having 1-4 carbon atoms or a single bond, and R⁵ represents a 5- to 7-membered cyclic alkyl group, an aryl group, a heteroaryl group or a 4- to 7-membered saturated or partially saturated heterocyclic group (the cyclic alkyl group, aryl group, heteroaryl group and heterocyclic group may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OZ₁₋₄, a group of

S(O)_nZ₁₋₄, a group of N(R¹²)(R¹³), a group of Z₁₋₄, carboxyl group, a group of CO₂Z₁₋₄, group of CONH₂, a group of CONH(Z₁₋₄) and a group of CON(Z₁₋₄)(Z₁₋₄)), a group of —S(O)_nZ₀₋₄R⁵, a group of —N(R⁶)(R⁷) {R⁶ and R⁷ each independently represent hydrogen atom or Z₁₋₄, or they may bind to each other to form a saturated or unsaturated 5- to 7-membered ring (the ring may contain one or two hetero atoms as ring constituting atoms), and R⁶ and R⁷ may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OCON(R¹⁵)(R¹⁶), a group of CONR¹⁵(R¹⁶), a group of N(R¹²)CON(R¹⁵)(R¹⁶), a group of Z₁₋₄, a group of OZ₁₋₄, a group S(O)_nZ₁₋₄, group of CH₂OH, a group of (CH₂)_mN(R¹²)(R¹³), a group of Z₁₋₄CON(R¹⁵)(R¹⁶), a group of SO₂N(R¹²)(R¹³), a group of OSO₂N(R¹²)(R¹³), a group of OSO₂R¹², a group of NCOZ₁₋₄R¹⁵ (in the formula, R¹⁵ and R¹⁶ independently represent hydrogen atom, a group of Z₁₋₆R¹¹, a group of Z₁₋₄N(R¹²)(R¹³), a group of Z₁₋₄OH, and a group of Z₁₋₄OZ₁₋₄), carboxyl group, cyano group, a group of COZ₁₋₄R¹⁰, a group of CO-Z₁₋₄(R¹⁰)—N(R¹²)(R¹³) (R¹⁰ is a substituent corresponding to a side chain on an amino acid carbon or a group of -Z₁₋₄-R¹¹ (R¹¹ represents a substituent which forms a quaternary salt) and a group of

[0017] a 5- or 6-membered aryl group which may be substituted and a 5- or 6-membered unsaturated heterocyclic group which may be substituted;

[0018] W² represents a single bond or —C(R⁸)=C(R⁹)— (R⁸ and R⁹ each independently represent hydrogen atom, a halogen atom, a lower alkyl group, an alkoxy group, cyano group, carboxyl group, hydroxymethyl group, cyanomethyl group, vinyl group or a group of N(R¹²)(R¹³)), Q represents an acidic group, and W² and Q may bind together to form vinylidenethiazolidinedione in E- or Z-configuration or an equivalent heterocyclic ring;

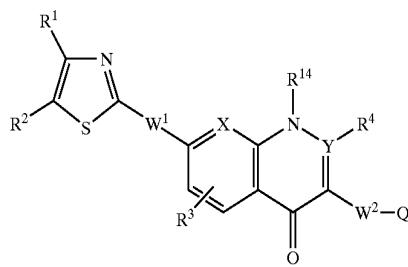

[0019] m and n each independently represent an integer of 0 to 2, and q represents an integer of 0 to 3.

[0020] As other aspects of the present invention, provided are a medicament for eliminating resistance of a microorganism with acquired drug resistance, which comprises a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof as an active ingredient; and a medicament for enhancing effect of an antimicrobial agent, which comprises a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof as an active ingredient. The aforementioned medicaments wherein the microorganism is *Pseudomonas aeruginosa* are preferred embodiments of the present invention. The present invention also provides a pharmaceutical composition for preventive and/

or therapeutic treatment of microbial infections, which comprises a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof together with an antimicrobial agent.

[0021] As further aspects of the present invention, provided are a method for preventive and/or therapeutic treatment of microbial infections, which comprises the step of administering to a mammal including human a preventively and/or therapeutically effective amount of a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof; a method for eliminating resistance of a microorganism with acquired resistance to an antimicrobial agent, which comprises the step of contacting with the microorganism an effective amount of a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof; a method for inhibiting acquisition of resistance to an antimicrobial agent by a microorganism, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof; a method for enhancing sensitivity of a microorganism to an antimicrobial agent, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof; and a method for improving effect of an antimicrobial agent, which comprises the step of administering to a mammal including human an effective amount of a compound represented by the aforementioned general formula (I) or a physiologically acceptable salt thereof. The compounds represented by the aforementioned general formula (I) or physiologically acceptable salts thereof are usually administered with one or more of antimicrobial agents simultaneously or separately, or successively. The present invention also provides a use of the compounds represented by the aforementioned general formula (I) or physiologically acceptable salts thereof for the manufacture of the aforementioned medicaments.

[0022] In addition to the aforementioned inventions, the present invention also provides a medicament for preventive and/or therapeutic treatment of microbial infections, which comprises as an active ingredient a compound represented by the following general formula (I), a physiologically acceptable salt thereof, or hydrates thereof

[0023] In the formula, R¹, R², R³, R⁴, W¹, W² and Q have the same meanings as those defined above; R¹⁴ represents hydrogen atom, Z₁₋₄, Z₁₋₄R⁵ or Z₁₋₄OR⁵; and X and Y each independently represent C—H or nitrogen atom.

[0024] In order to achieve the aforementioned second object, the inventors of the present invention conducted

various researches. As a result, they found that judgment of effectiveness of a combination of a drug efflux pump inhibitor and an antibacterial agent was quickly and conveniently made by applying a method of antibiotic susceptibility test utilizing agar medium in which inhibition zones formed on the surface of the medium are observed, and that a type of drug efflux pump expressed in an etiologic bacterium was identifiable by using a combination of a particular antibacterial agent and a drug efflux pump inhibitor, and existence of two or more kinds of drug efflux pumps expressed in a microorganism was verified in a simple manner. The present invention was achieved on the basis of these findings.

[0025] The present invention thus provides a method for judging effectiveness of a drug efflux pump inhibitor against a microorganism, which comprises the steps of:

[0026] (A1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent as a spot on the surface of the agar medium and culturing the microorganism;

[0027] (A2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during the culture period;

[0028] (A3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist; and

[0029] (A4) judging that the drug efflux pump inhibitor is effective against the microorganism when the growth degree of the microorganism determined in the step (A2) is significantly higher than the growth degree of the microorganism determined in the step (A3).

[0030] As preferred embodiments of the aforementioned method, provided are the aforementioned method wherein the antibacterial agent is provided as a spot on the agar medium surface by means of a disk; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium; and the aforementioned method wherein the microorganism is *Pseudomonas aeruginosa*.

[0031] In another preferred embodiment, the aforementioned method further comprises steps of (A5) providing two or more kinds of antibacterial agents each as a spot with a space between said spots in the step (A1); (A6) determining a growth degree of the microorganism in a region of the agar medium in which the two or more kinds of antibacterial agents that have diffused into the agar medium during culture period coexist; (A7) determining a growth degree of the microorganism in a region of the agar medium in which the two or more kinds of antibacterial agents that have diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist; and (A8) judging that the drug efflux pump inhibitor is effective against the microorganism when the growth degree of the microorganism determined in the step (A6) is significantly higher than the growth degree of the microorganism determined in the step (A7).

[0032] As preferred embodiments of the aforementioned method, provided are the aforementioned method wherein the antibacterial agents are provided each as a spot on the agar medium surface each by using a disk; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium; and the aforementioned method wherein the microorganism is *Pseudomonas aeruginosa*.

[0033] As another aspect, the present invention provides a method for identifying a drug efflux pump expressed in a microorganism, which comprises the steps of:

[0034] (B1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent that can be excreted by a particular drug efflux pump as a spot on the surface of the agar medium and culturing the microorganism;

[0035] (B2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during culture period;

[0036] (B3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that said drug efflux pump inhibitor is a specific inhibitor for the particular drug efflux pump); and

[0037] (B4) judging that the microorganism expresses the drug efflux pump of the particular type when the growth degree of the microorganism measured in the step (B2) is significantly higher than the growth degree of the microorganism determined in the step (B3).

[0038] As preferred embodiments of the aforementioned method, provided are the aforementioned method wherein the antibacterial agent is provided as a spot on the agar medium surface by using a disk; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium; and the aforementioned method wherein the microorganism is *Pseudomonas aeruginosa*.

[0039] As a further aspect, the present invention provides a method for verifying expression of two or more kinds of drug efflux pumps in a microorganism, which comprises the steps of:

[0040] (C1) spreading a microorganism to be tested on a surface of an agar medium, then providing two or more kinds of antibacterial agents (provided that each of the two or more kinds of the antibacterial agents has different effluxing specificity by the two or more kinds of drug efflux pumps, and one of the two or more kinds of the antibacterial agents (hereinafter referred to as "Antibacterial agent (1)")

has a property of being excreted by only one of the two or more kinds of the drug efflux pumps (hereinafter referred to as "Drug efflux pump (1)", whilst the other antibacterial agent or agents have a property of being excreted by Drug efflux pump (1) and the other drug efflux pump or pumps);

[0041] (C2) determining a growth degree of the microorganism in a region of the agar medium into which each antibacterial agent has solely diffused during culture period;

[0042] (C3) determining a growth degree of the microorganism in a region of the agar medium in which each antibacterial agent that has solely diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that the drug efflux pump inhibitor is a specific inhibitor for Drug efflux pump (1)); and

[0043] (C4) judging that the microorganism expresses Drug efflux pump (1) and one or more kinds of other drug efflux pumps when the growth degree of the microorganism determined in the step (C2) is significantly higher than the growth degree of the microorganism determined in the step (C3) for Antibacterial agent (1) and the growth degree of the microorganism determined in the step (C2) is significantly lower than the growth degree of the microorganism determined in the step (C3) for the other antibacterial agent or agents.

[0044] As preferred embodiments of the aforementioned method, provided are the aforementioned method wherein the two or more kinds of antibacterial agents include a combination of a β -lactam antibiotic and a quinolone antibacterial agent; the aforementioned method wherein one of the two or more kinds of drug efflux pumps is a MexAB-OprM pump; and the aforementioned method wherein the microorganism is *Pseudomonas aeruginosa*. Also provided are the aforementioned method wherein each of the antibacterial agents is provided as a spot on the agar medium surface each by using a disk; the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface; and the aforementioned method wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium.

BRIEF EXPLANATION OF THE DRAWINGS

[0045] FIG. 1 shows the results of determination performed by using disks according to the method of the present invention. In the figure, the disk on the left side contained Aztreonam (AZT: 30 μ g), the disk at the center contained 5% DMSO solution alone (negative control) in the case of without efflux pump inhibitor or Compound A (50 μ g) in the case of with efflux pump inhibitor, and the disk on the right side contained Levofloxacin (LVFX: 5 μ g). Change of zone represents the change in zone shape on the agar medium, and WB represents the result of the protein analysis by Western blotting method.

[0046] FIG. 2 shows the results of the measurement performed by using Etest instead of disks. In the figure, Etest on the left side contained Aztreonam (AZT: 256-0.016 μ g/mL) and Etest on the right side contained Levofloxacin (LVFX: 32-0.002 μ g/mL). MIC with Etest represents the minimum inhibitory concentration defined by Etest system, and WB represents the result of the protein analysis by Western blotting method.

BEST MODE FOR CARRYING OUT THE
INVENTION

[0047] In the specification, the "alkyl group" means a linear, branched or cyclic alkyl group or an alkyl group consisting of a combination thereof. The same is applied to an alkyl moiety of a substituent having the alkyl moiety (for example, fluoroalkyl group).

[0048] In the general formula (I), R¹ is preferably an alkyl group. Examples of the alkyl group include a linear or branched alkyl group having 1-8 carbon atoms (for example, methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, isobutyl group, sec-butyl group, tert-butyl group, n-pentyl group and the like), and a cyclic alkyl group having 3-8 carbon atoms, preferably 3-6 carbon atoms (for example, cyclopropyl group, cyclobutyl group, cyclopentyl group, cyclohexyl group and the like). The cyclic alkyl group may have another alkyl group or a halogen atom, hydroxyl group or the like on the ring. R¹ is also preferably an aryl group, a heteroaryl group or a heterocyclic group. The aryl group may preferably have a 5- or 6-membered ring. As the heterocyclic group, a heterocyclic group having 3-8, preferably 3-6, of ring constituting atoms can be used, and the ring may be saturated or partially saturated. As a substituent that binds to the heterocyclic group, for example, an alkyl group or a halogen atom is preferred.

[0049] R² is preferably hydrogen atom or a halogen atom.

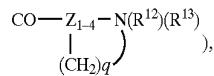

[0050] W¹ is preferably a linking group having a length of two atoms, and —CH=CH—, —N(R¹²)CO—, —CON(R¹²)—, —CH₂O— and —CH₂CH₂— are more preferred.

[0051] R³ is preferably hydrogen atom, a halogen atom, amino group or hydroxyl group.

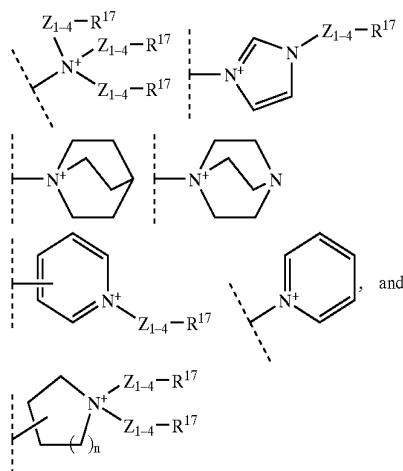

[0052] R⁴ is preferably hydrogen atom, —OZ₀₋₄R⁵ or —N(R⁶)(R⁷).

[0053] R⁵ is preferably a 5- or 6-membered aryl group, 5- to 7-membered alicyclic group, 4- to 7-membered saturated heterocyclic group, or 5- or 6-membered unsaturated heterocyclic group, which may be substituted, and more preferably a 4- to 7-membered saturated heterocyclic group or a 5- or 6-membered unsaturated heterocyclic group.

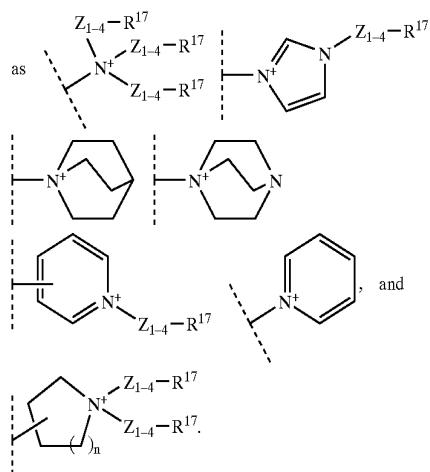

[0054] R⁶ and R⁷ represent hydrogen atom, an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms, or they bind to each other to form a saturated or unsaturated 5- to 7-membered ring. The ring may contain one or two hetero atoms as atoms constituting the ring. R⁶ and R⁷ may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OCON(R¹⁵)(R¹⁶), a group of CON(R¹⁵)(R¹⁶), a group of N(R¹²)CON(R¹⁵)(R¹⁶), a group of Z₁₋₄, a group of OZ₁₋₄, a group S(O)_nZ₁₋₄, a group of CH₂OH, a group of (CH₂)_mN(R¹²)(R¹³), a group of Z₁₋₄CON(R¹⁵)(R¹⁶), a group of SO₂N(R¹²)(R¹³), a group of OSO₂N(R¹²)(R¹³), a group of OSO₂R¹², a group of NCOZ₁₋₄R¹⁵ (in the formula, R¹⁵ and R¹⁶ independently represent hydrogen atom, a group of Z₁₋₆R¹¹, a group of Z₁₋₄N(R¹²)(R¹³), a group of Z₁₋₄OH, and a group of Z₁₋₄OZ₁₋₄), carboxyl group, cyano group, a group of COZ₁₋₄R¹⁰, a group of CO-Z₁₋₄(R¹⁰)—N(R¹²)(R¹³) (R¹⁰ is a substituent corresponding to a side chain on an amino acid carbon or a group of -Z₁₋₄-R¹¹ (R¹¹ represents a substituent which forms a quaternary salt) and a group of

[0055] wherein R¹⁰ is a substituent on α-carbon atom of an amino acid, or a group comprising an alkyl group or a fluoroalkyl group having 1-4 carbon atoms and a quaternary salt such as

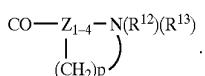

[0056] substituted at the terminal of said alkyl or fluoroalkyl group (in the definitions of the aforementioned substituents, R¹² and R¹³ represent hydrogen atom, an alkyl group or a fluoroalkyl group having 1-4 carbon atoms, n independently represents an integer of 0 to 2, and q represents an integer of 0 to 3). Preferred examples of R¹¹ also include a quaternary salt such

[0057] R¹⁷ represents hydrogen atom, halogen atom, hydroxyl group, carboxyl group, carbamoyl group, N-alkylcarbamoyl group, N,N-dialkylcarbamoyl group, dihalogenomethyl group, or trihalogenomethyl group.

[0058] More preferably, R⁶ and R⁷ form a piperidine ring or the like and said ring has a substituent such as fluorine atom, hydroxyl group, a group of OCON(R¹⁵)(R¹⁶) and a group of CON(R¹⁵)(R¹⁶) and a group of Z₁₋₄CON(R¹⁵)(R¹⁶) on the ring. As the ring formed by R⁶ and R⁷ bound to each other, a piperazine ring is also preferred, and preferred examples include a piperazine ring of which 4-position (nitrogen atom not bound to the pyridopyrimidine ring) is substituted with an alkyl group or a fluoroalkyl group having 1-4 carbon atoms, or with other substituent such as COZ1, 4R¹⁰, CO-Z₁₋₄N(R¹²)(R¹³) and

[0059] W² is preferably a single bond or a group represented by —C(R⁸)=C(R⁹)—. R⁸ and R⁹ each independently represent hydrogen atom, a halogen atom, a lower alkyl group, an alkoxy group, cyano group, carboxyl group, hydroxymethyl group, cyanomethyl group, vinyl group or a group of N(R¹²)(R¹³), more preferably hydrogen atom, a halogen atom or a lower alkyl group.

[0060] Q represents an acidic group, preferably an acidic group which is carboxyl group, 1,2,3,4-tetrazol-5-yl group or an equivalent thereof. However, type of the acidic group is not particularly limited, and said group may be any one of

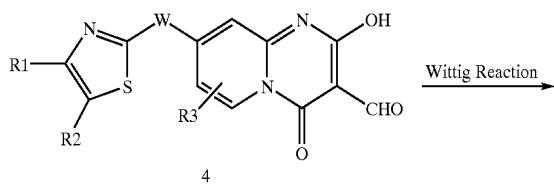

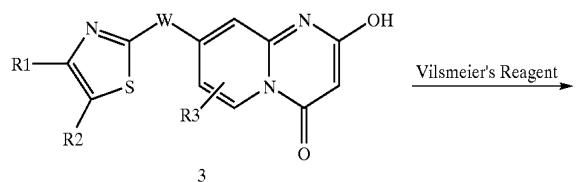

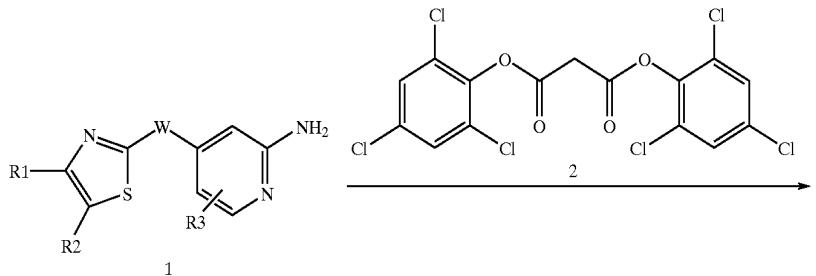

cyclic or non-cyclic, or a combination thereof. Examples include a lower alkoxy group, hydroxyl group, carboxyl group, N-cyanocarboxamido group, a methanesulfonylamido group having 1-3 fluorine atoms, —CONH-(5-tetrazolyl) group, 5-tetrazolyl group which may be substituted, 1,2,3-triazolyl group which may be substituted, 2,4-dioxothiazolidin-5-ylidенyl group which may be substituted, 4-oxo-2-thioxothiazolidin-5-ylidенyl group which may be substituted, 5-oxo-4-tetrazolyl group which may be substituted, 3-(5-oxo)-[1.2.4]oxadiazolidinyl group which may be substituted, 2-(3,5-dioxo)-[1.2.4]oxadiazolidinyl group which may be substituted, 5-(3-oxo)-[1.2.4]oxadiazolidinyl group which may be substituted, 3-(5-oxo)-[1.2.4]isoxazolidyl group which may be substituted or the like. More preferred examples include carboxyl group, 5-tetrazolyl group which may be substituted, N-cyanocarboxamido group, a methanesulfonylamido group that has 1-3 fluorine atoms, —CONH-(5-tetrazolyl) group or the like.

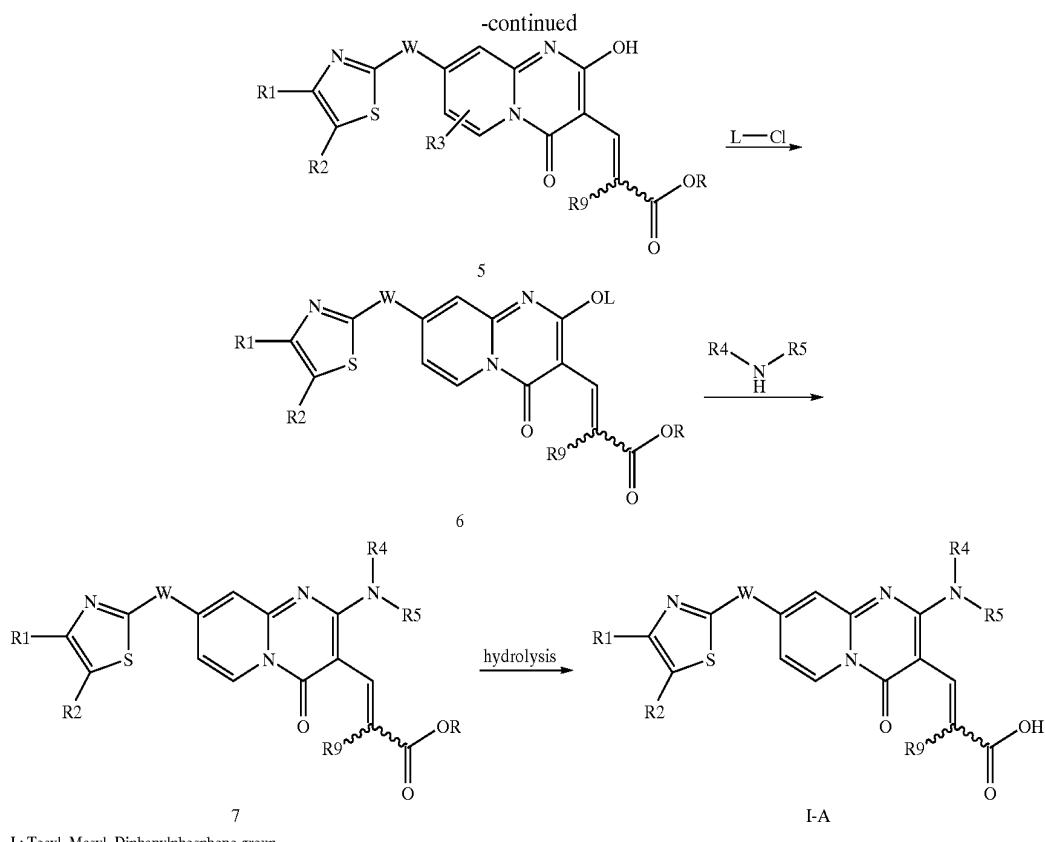

[0061] For R^1 , R^2 , R^3 , R^4 , W^1 , W^2 and Q of the compounds represented by the general formula (II), those explained as for R^1 , R^2 , R^3 , R^4 , W^1 , W^2 and Q in the aforementioned general formula (I) can be preferably used, respectively.

[0062] R^{14} is preferably an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms.

[0063] The compounds represented by the aforementioned general formula (I) can be produced by the following methods.

Scheme 1

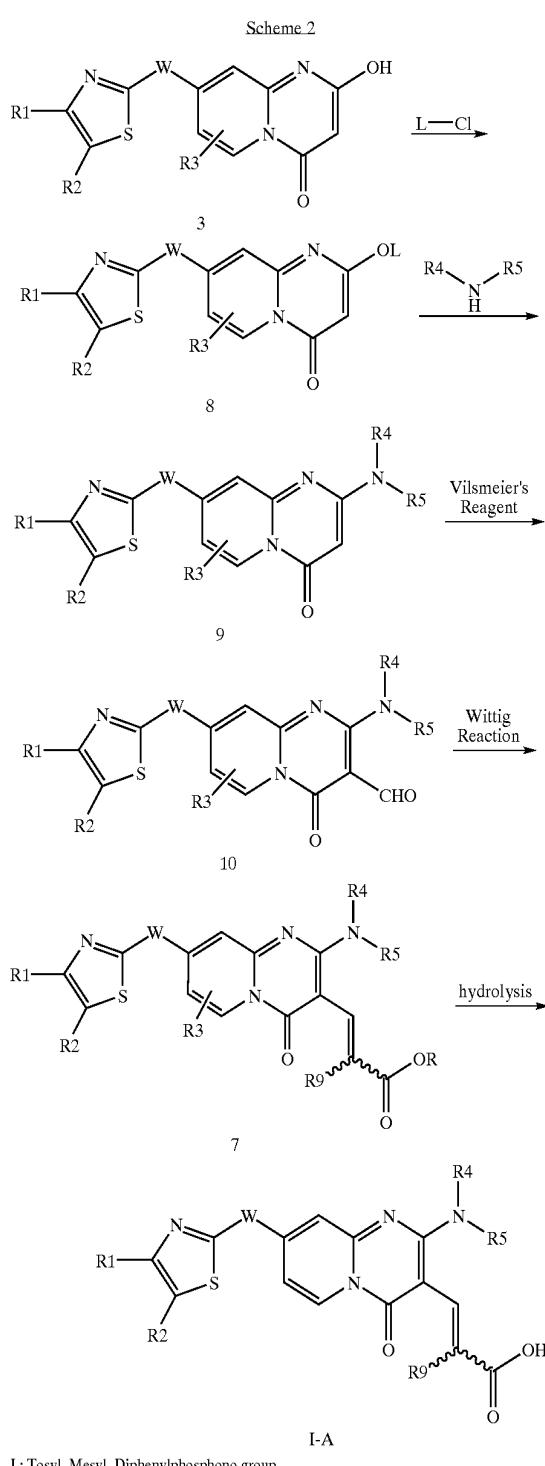

[0064] As shown in Scheme 1, Compound 3 can be obtained by heating Aminopyridine derivative 1 and malonic acid or an ester of malonic acid in a solvent such as toluene and xylene. As the ester of malonic acid, Ester 2 as a phenol ester substituted with an electron withdrawing group such as a halogen atom can be used. An alkyl ester can also be used. By formylating Compound 3 with Vilsmeier's reagent prepared from phosphorus oxychloride or oxalyl chloride and dimethylformamide (DMF), Aldehyde 4 can be obtained. By subjecting Compound 4 to the Wittig reaction or Horner-Emons reaction, Acrylic acid derivative 5 can be synthesized. Where the Wittig reaction is employed, Compound 5 can be obtained by reacting an alkyloxycarbomethylenetriphenylphosphorane which may be substituted with the aldehyde compound in an inert solvent such as tetrahydrofuran, DMF or methylene chloride. Where the Horner-Emons reaction is employed, the target compound can be synthesized by reacting the aldehyde compound with a dialkylphosphonoacetic acid ester which may be substituted at the 2-position in the presence of a base in an inert solvent such as THF and DMF. Compound 7 having amino group at the 2-position as a linker can be obtained by converting the hydroxyl group at the 2-position of Compound 5 into tosyl group, mesyl group, diphenylphosphoric acid ester or the like, and then replacing the resulting group with an amine. The ester group of the acrylic acid moiety can be hydrolyzed in the final step to obtain Compound I-A. As the ester group, a lower alkyl ester such as those of methyl group and ethyl group, tert-butyl ester, benzyl ester, allyl ester and so forth can be used, and they can be hydrolyzed by hydrolysis under

an alkaline or acidic condition, catalytic reduction or a method by using a metal catalyst such as palladium.

[0065] Further, Compound I-A can also be synthesized by the method shown in Scheme 2. Compound 9 can be obtained by converting the hydroxyl group at the 2-position of Compound 3 into tosyl group, mesyl group, diphenylphosphoric acid ester or the like and then replacing the resulting group with an amine. The resulting product can be formylated with Vilsmeier's reagent prepared from phosphorus oxychloride or oxalyl chloride and dimethylformamide to obtain Aldehyde 10. By subjecting Compound 10 to the Wittig reaction or Horner-Emons reaction, Acrylic acid derivative 7 can be synthesized. Where the Wittig reaction is employed, Compound 7 can be obtained by reacting an alkyloxycarbomethylenetriphenylphosphorane which may be substituted with the aldehyde compound in an inert solvent such as THF, DMF, toluene or methylene chloride. Where the Horner-Emons reaction is employed, the target compound can be synthesized by reacting the aldehyde compound with a dialkylphosphonoacetic acid ester which may be substituted at the 2-position in the presence of a base in an inert solvent such as THF and DMF.

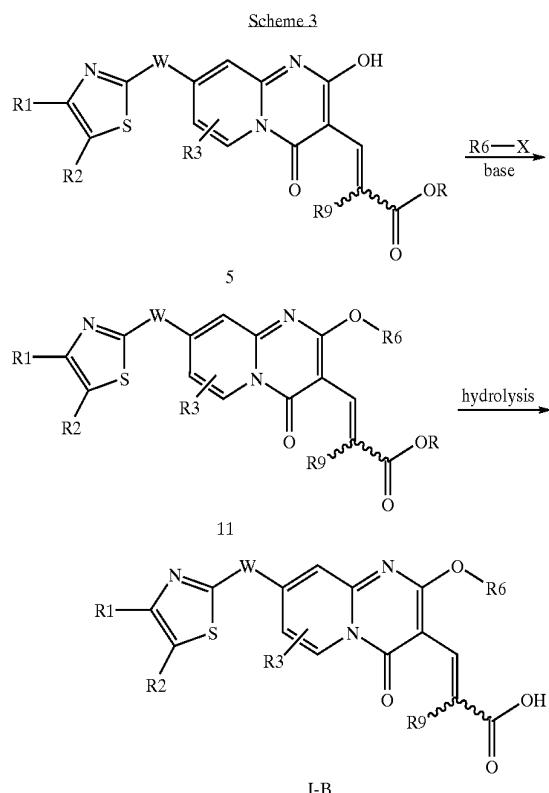

[0066] According to this synthetic scheme, various primary or secondary amines can be reacted with Compound 6 to synthesize variety of 2-substituted derivatives by the multiple parallel synthesis method in a liquid phase.

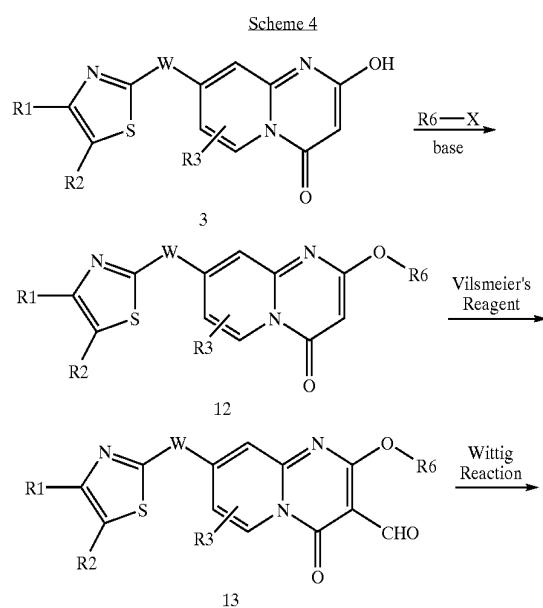

[0067] A compound in which a substituent is introduced at the 2-position of the pyridopyrimidine ring as a linker can be synthesized by the method shown in Scheme 3.

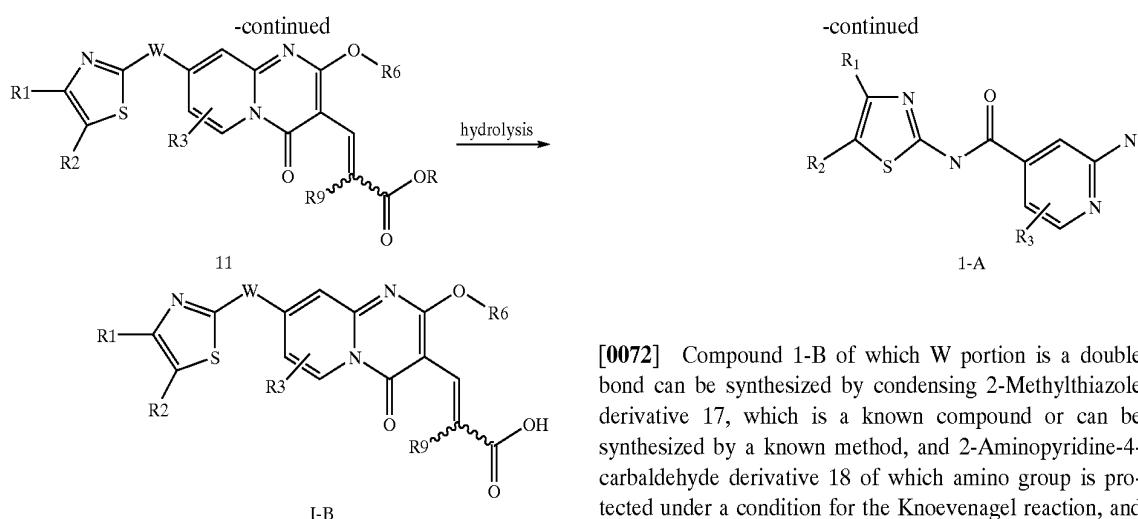

[0068] Compound 11 can be synthesized by reacting Compound 5 with an alkylating agent in the presence of a base. The ester portion of the resulting Compound 11 can be hydrolyzed to obtain Compound I-B in a manner similar to

that for the aforementioned compound having a nitrogen atom as a linker.

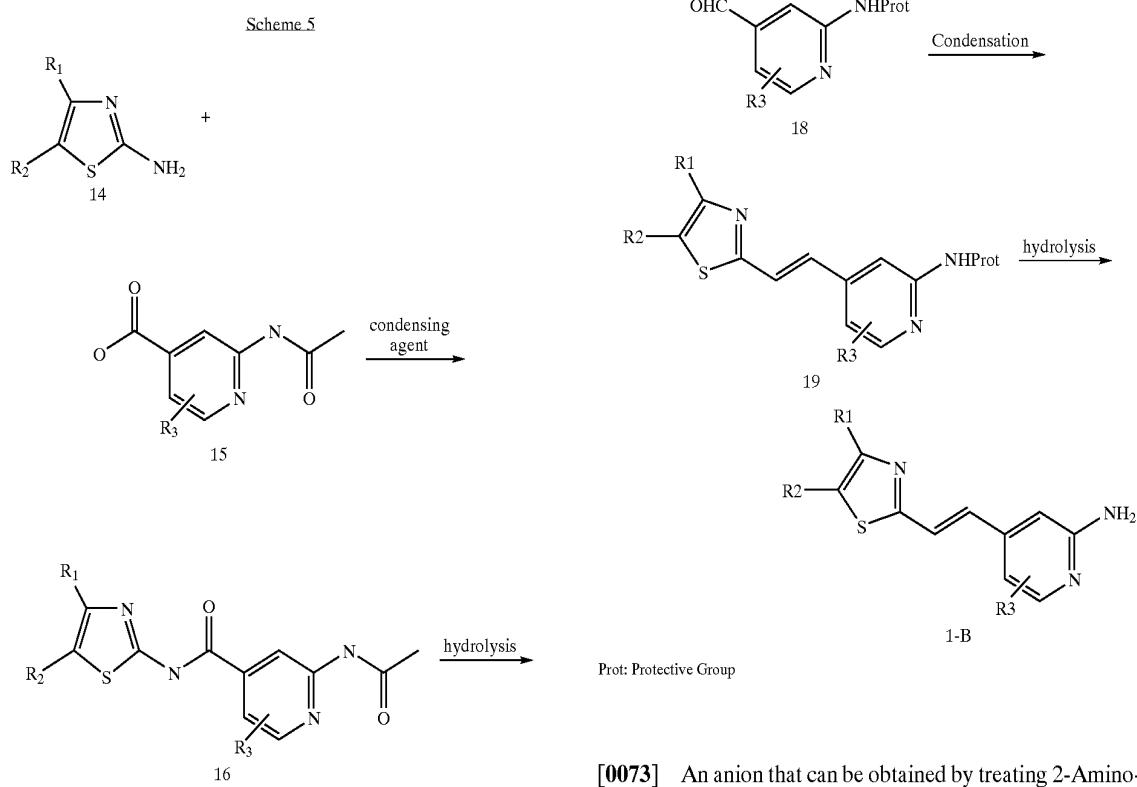

[0069] Compound I-B can also be synthesized by the method shown in Scheme 4, i.e., by alkylation of Compound 3 with an alkylating agent and subsequent formylation, olefination and deprotection of the ester portion.

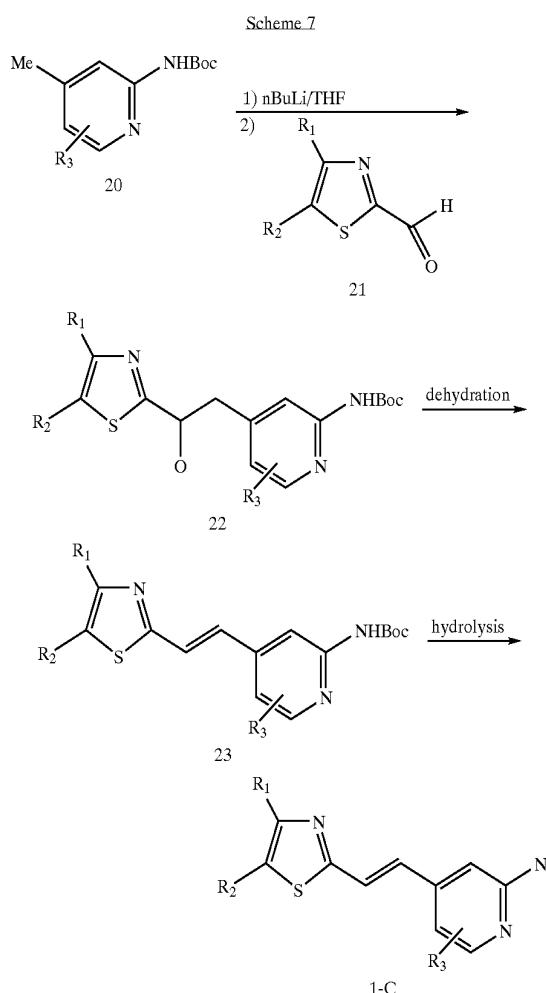

[0070] Compound 1 used for the aforementioned synthesis can be synthesized as follows.

[0071] For example, Compound 1-A of which W portion is an amide bond can be synthesized by condensing an aminothiazole derivative, which is a known compound or can be synthesized by a known method, and a 2-aminopyridine-4-carboxylic acid derivative of which amino group is protected by a usual method used for a reaction of forming a peptide bond, and deprotecting the protective group of the amino group.

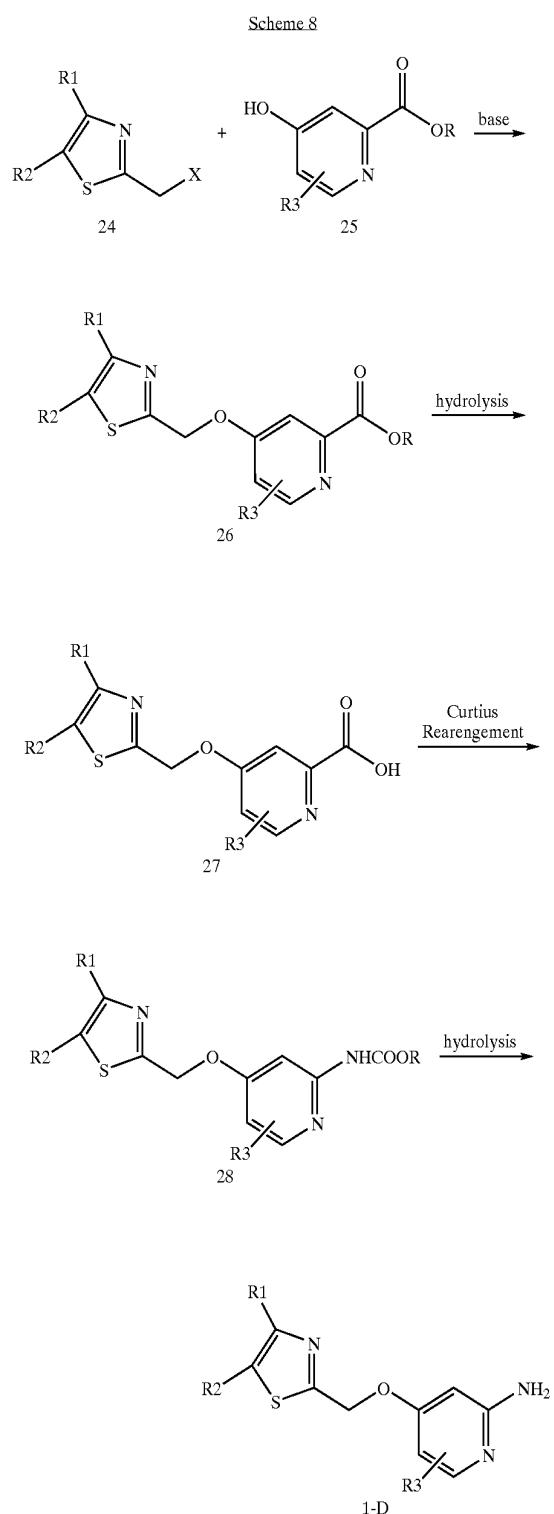

[0073] An anion that can be obtained by treating 2-Amino-4-methylpyridine derivative 20 of which amino group is

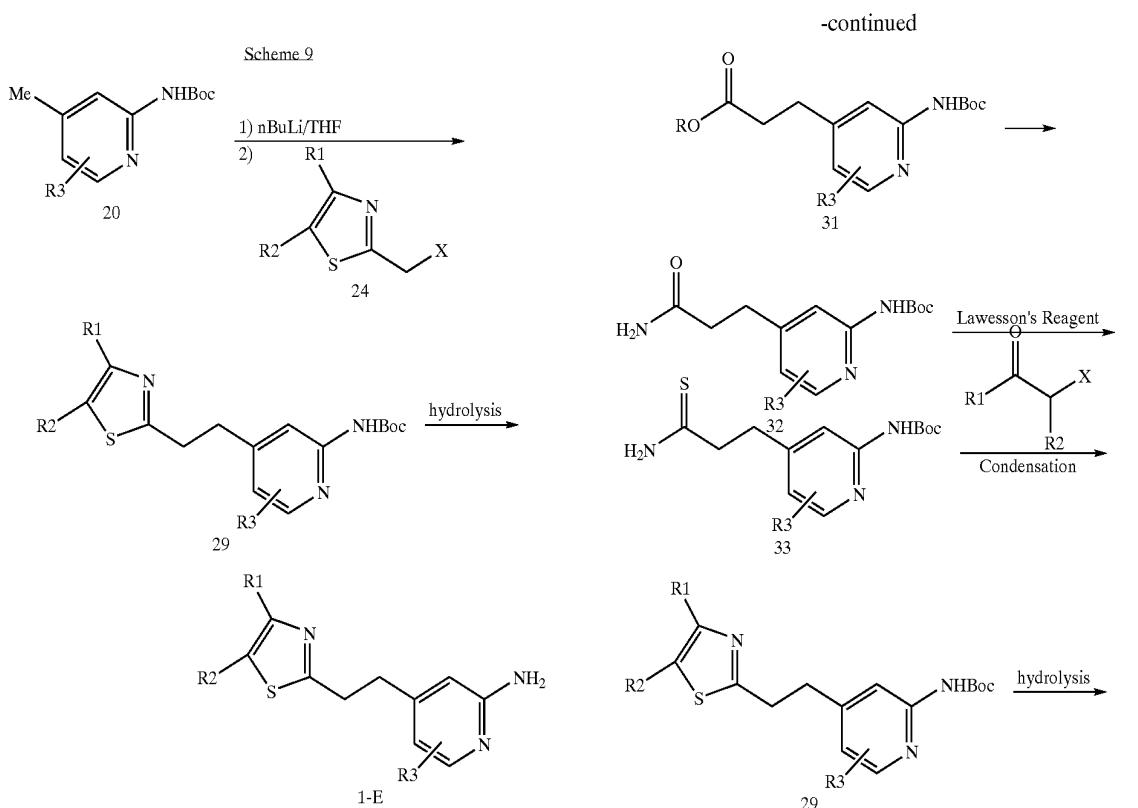

protected with a strong base such as n-BuLi and an aldehyde are reacted, and then the resulting hydroxyl group can be subjected to tosylation, mesylation or the like, or the resulting product is converted into a halogenated compound such as by chlorination or bromination. The resulting product is then subjected to elimination reaction using a base such as DBU to obtain Double bond-containing derivative 23. By removing its amino protective group, Compound 1-C can be synthesized.

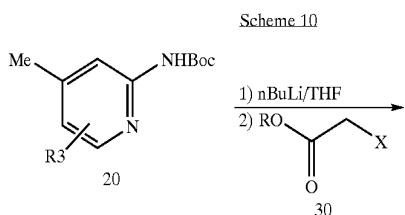

[0074] Compound 1-D of which W portion is an ether bond can be synthesized by condensing Thiazolemethyl halide 24, which is a known compound or can be synthesized by a known method, and 4-Hydroxypyridine-2-carboxylic acid ester 25 in the presence of a base, hydrolyzing the ester portion of the resulting Compound 26, and then converting the produced carboxylic acid into Amine derivative 28 by employing the Curtius rearrangement or the like. Amino compound 1-D can also be obtained by first converting the carboxylic acid into a condensation product with hydrazine, then converting the resulting product into an acid azide with a nitrous acid salt or a derivative thereof, further subjecting the resulting product to a rearrangement reaction and, if required, removing the protective group of the amino group.

[0075] Compound 1-E, where W portion is ethylene, can be synthesized by reacting an anion, obtained by treating 2-Amino-4-methylpyridine derivative 20 of which amino group is protected with a strong base such as n-BuLi, with Thiazolemethyl halide 24 to obtain a condensation product and then removing the protective group of the amino group.

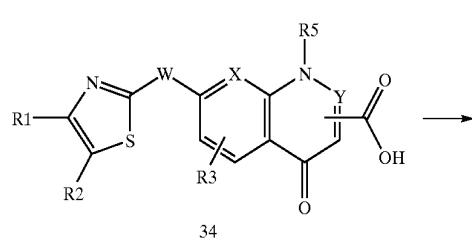

[0076] As shown in Scheme 10, Compound 1-E can also be synthesized by reacting an anion, obtained by treating 2-Amino-4-methylpyridine derivative 20 of which amino group is protected with a strong base such as n-BuLi, with Halogenoacetic acid derivative 30 to obtain a condensation product, converting the ester portion into an amide, then converting the resulting product into a thioamide compound by using Lawesson's reagent, diphosphorous pentasulfide or the like and condensing the product with a haloketone compound.

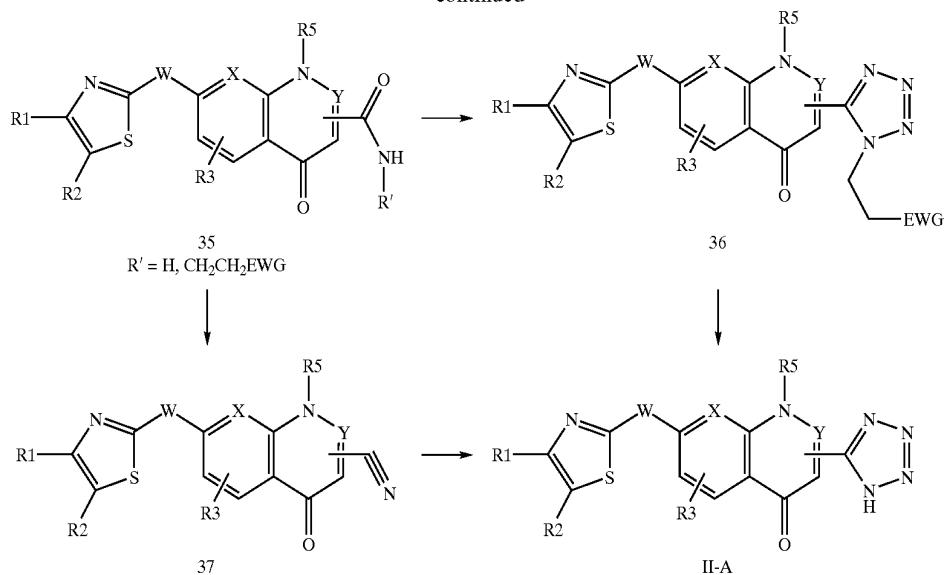

[0077] A compound of which W portion is a triple bond can be synthesized by the synthetic methods described in WO9633181 and WO961024.

[0078] The compound represented by the general formula (II) can be synthesized by the method shown in Scheme 11.

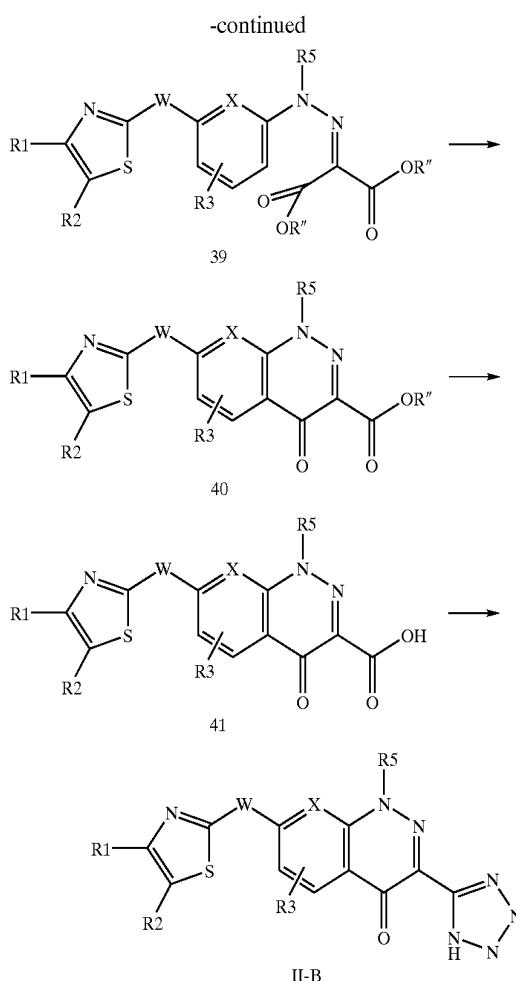

-continued

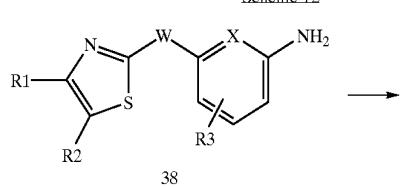

[0079] Amide derivative 35 can be obtained by converting N-Alkyl-quinolonecarboxylic acid derivative 34 described in PCT/JP00/07565 into a mixed acid anhydride, and then reacting the resulting product with ammonia or an ethylamine having an electron-withdrawing group (EWG) such as cyanoethylamine and 3-aminopropanoic acid ester. The alkylamide derivative can be converted into Compound 36 by treatment with sodium azide and trifluoromethanesulfonic acid anhydride in an acetonitrile solvent to form a tetrazole ring. Then, the product can be converted into Tetrazole compound II-A by treatment with DUB in an inert solvent such as methylene chloride or treatment with a base such as sodium methoxide in an alcohol.

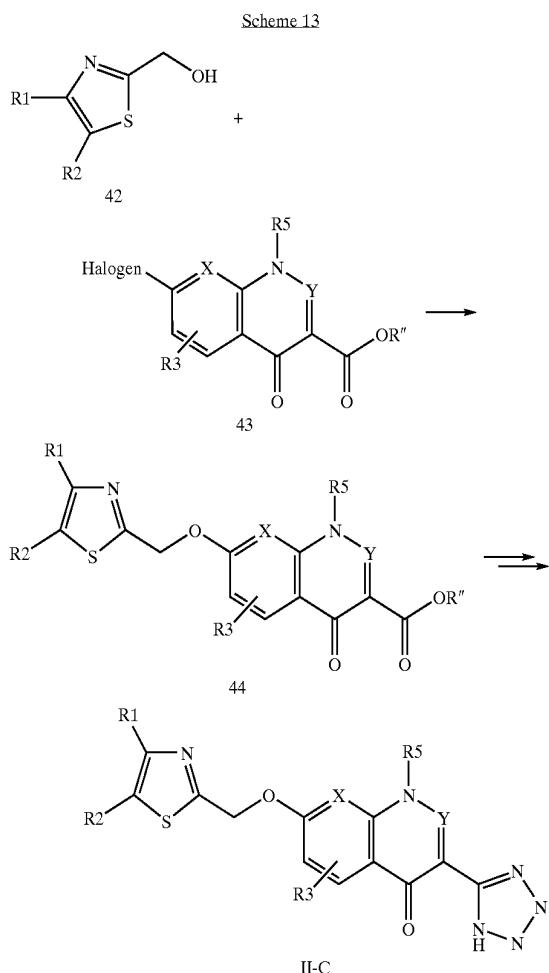

[0080] Further, Tetrazole compound II-A can similarly be obtained by subjecting Carbamoyl derivative 35 to dehydration reaction to obtain Cyano derivative 37 and treating the resulting compound with sodium azide and aluminum chloride in dimethylformamide. Similarly, Tetrazole compound II-A can be produced by subjecting Carboxylic acid 34 having a cinnolin-4-one or naphthylidin-4-one structure to the same treatment.

Scheme 12

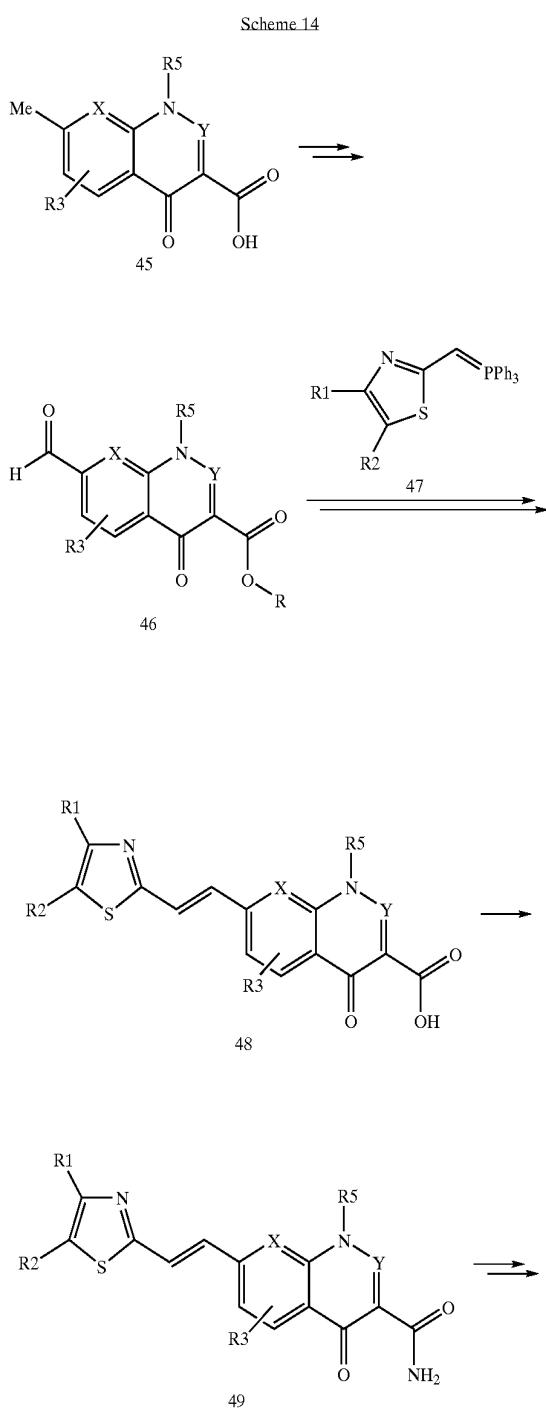

[0081] As shown in Scheme 12, where a derivative having a cinnolin-4-one structure is desired, Compound 38, which is a known compound or can be easily derived from a known compound, can be converted into a diazo compound by treating the amino group with sodium nitrite, and the resulting product can be reacted with a malonic acid ester to obtain Compound 39 ($R^5=H$). An electrophilic reagent such as an alkyl halide can be reacted with the nitrogen atom of the resulting Compound 39 ($R^5=H$) by using a base such as sodium hydride and potassium carbonate in a solvent such as DMF and THF, and then the product can be heated in a solvent such as Dowtherm A and PPA and treated under an ordinary hydrolysis condition to obtain Carboxylic acid 41. The Carboxylic acid 41 obtained can be subjected to a treatment similar to the aforementioned treatment (Scheme 11) to produce Tetrazole compound II-B.

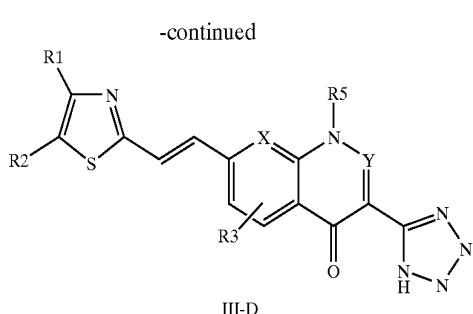

[0082] As shown in Scheme 13, when W portion is $-\text{CH}_2\text{O}-$, Compound 42 can be converted into an alkoxide by treatment with a strong base such as sodium hydride in DMF or THF, and the alkoxide can be reacted with Compound 43, which is a known compound or can be synthesized by a known method (Japanese Patent Un-examined Publication (Kokai) No. 57-144264 or 60-197686), to obtain Compound 44. Subsequently, Compound 44 can be converted into a carboxylic acid by hydrolysis and subjected

to a treatment similar to the aforementioned treatment (Scheme 11) to produce Tetrazole compound II-C.

[0083] As for the aforementioned production of cinnolin-4-one derivative, a method wherein 3-chloro-4-fluoroaniline is used as a starting material is compared with a method wherein 3,4-difluoroaniline is used, 3,4-difluoroaniline will give much higher yield of cinnolin-4-one-3-carboxylic acid as for the thermal cyclization reaction performed in a solvent such as Dowtherm A and PPA in the production of the known Compound 43 and selectivity of the substitution of the alkoxide shown in Scheme 13.

[0084] As shown in Scheme 14, where the compound in which W is an olefin is desired, Compound 45, which is a known compound or can be synthesized by a known method, can be esterified and then subjected to treatment with an oxidizing agent such as selenium dioxide, and the resulting Aldehyde derivative 46 and Compound 47 can be subjected to the Wittig reaction and further subjecting the adduct to addition of ammonia to obtain Carbamoyl compound 49. The resulting Carbamoyl derivative 49 can be converted into Tetrazole compound II-D by using the same method as in Scheme 11.

[0085] The synthetic intermediates and the target compounds in the aforementioned preparations can be isolated and purified by using methods for isolation and purification ordinarily used in the field of organic synthetic chemistry, for example, neutralization, filtration, extraction, drying, concentration, recrystallization, various chromatographic techniques and the like. The synthetic intermediates may be used in subsequent reactions without purification. When a salt of compound of the general formula (I) or (II) is desired, a product obtained in the form of a salt may be purified without any treatment. When a product is obtained in a free form, a salt can be formed by dissolving or suspending the product in a suitable organic solvent, and then adding an acid or base. It is also possible to convert a compound represented by the general formula (I) or (II) obtained in the form of a salt into a compound in a free form, and then convert the result into an appropriate salt.

[0086] Although it is not intended to be bound by any specific theory, the compounds represented by the general formula (I) have an activity for inhibiting drug efflux pumps of microorganisms. More specifically, the compounds represented by the general formula (I) can act on a microorganism with acquired resistance to an antimicrobial agent to inhibit its drug efflux pump, and eliminate the resistance of the microorganism. In addition, the compounds represented by the general formula (I) can act on a microorganism to inhibit a drug efflux pump, thereby suppress the acquisition of resistance to an antimicrobial agent by a microorganism. Therefore, the medicament of the present invention that comprises a compound represented by the general formula (I) as an active ingredient is useful for preventive and/or therapeutic treatment of microbial infections, generally by a combinational administration with an antimicrobial agent. The medicament of the present invention is extremely useful as a medicament for preventive and/or therapeutic treatment of, in particular, infectious diseases caused by a microorganism with acquired resistance to one or more antimicrobial agents.

[0087] Methods for using the medicament of the present invention are not particularly limited. Examples include a method of administering one or more antimicrobial agents, and also administering the medicament of the present invention simultaneously, separately, or successively to enhance the activity of the antimicrobial agent(s); and a method of preparing a pharmaceutical composition comprising one or more antimicrobial agents and the medicament of the present invention (so-called a compound drug) and the administering the composition.

[0088] Kinds of microbial infections that are applicable by the medicament of the present invention are not particularly limited. Bacteria are suitable as target microorganisms. The medicament of the present invention can be used for various infections by microorganisms including Gram-positive or Gram-negative bacteria, aerobic or anaerobic bacteria and the like. The medicament of the present invention can most suitably be used for infections by *Pseudomonas aeruginosa* with acquired resistance to one or more antimicrobial agents, or infections by *Pseudomonas aeruginosa* with low sensitivity to antimicrobial agents. The medicament of the present invention can be used for microbial infections of mammals including human.

[0089] Drugs having variety of structures have been known as antimicrobial agents, and various drugs are clinically used. Kinds of antimicrobial agents that can be administered in combination with the medicament of the present invention are not particularly limited, and examples include, for example, penicillin (penam) antibiotics, cephalosporin (cephem) antibiotics, oxacephem antibiotics, penem antibiotics, carbapenem antibiotics, monobactam antibiotics, aminoglycoside antibiotics, macrolide antibiotics, chloramphenicol antibiotics, tetracycline antibiotics, glycopeptide antibiotics, phosphomycin antibiotics, lincomycin antibiotics, sulfonamide preparations, p-aminosalicylic acid preparations, isonicotinic acid hydrazide preparations, quinolone synthetic antimicrobial agents and the like. However, antimicrobial agents are not limited to these examples. When a pharmaceutical composition comprising one or more antimicrobial agents together with the medicament of the present invention is manufactured, the antimicrobial agents exemplified above can also be used.

[0090] As the active ingredient of the medicament of the present invention, a substance selected from the group consisting of the compounds represented by the formula (I) and pharmaceutically acceptable salts thereof, and hydrates thereof and solvates thereof can be used. Two or more of the substances may be used in combination. The aforementioned substance, per se, may be administered as the medicament of the present invention. Generally, however, it is desirable that the substance is administered in the form of a pharmaceutical composition comprising one or more of the aforementioned substances as the active ingredient together with one or more pharmaceutical additives. The pharmaceutical composition may optionally be added with one or more of other pharmaceutically active ingredients such as the aforementioned antimicrobial agents and β -lactamase inhibitors.

[0091] A pharmaceutical composition for the use of administration *in vivo* can be readily prepared by mixing one or more of the aforementioned substances as the active ingredient and one or more pharmaceutically acceptable

additives for pharmaceutical preparations according to methods for formulation ordinarily used in the field of manufacturing pharmacy. The route of administration of the medicament of the present invention is not particularly limited; however, it is desirable to appropriately chose the most effective administration route for preventive and/or therapeutic treatment of a target infectious disease. Examples of pharmaceutical compositions suitable for oral administration include, for example, capsules, powders, tablets, granules, subtilized granules, emulsions, syrups, solutions, suspensions and the like. Examples of pharmaceutical compositions suitable for parenteral administration include, for example, inhalants, sprays, intrarectal preparations, injections, drip infusions, ointments, creams, transdermal preparations, transmucosal preparations, eye drops, nasal drops, ear drops, tape preparations, patches and the like. However, the forms of the medicament of the present invention are not limited to these examples.

[0092] Among the pharmaceutical compositions suitable for oral administration, liquid preparations such as emulsions and syrups can be prepared by using pharmaceutical additives including water; saccharides such as sucrose, sorbitol, fructose; glycols such as polyethylene glycol and propylene glycol; oils such as sesame oil, olive oil and soybean oil; antiseptics such as p-hydroxybenzoic acid esters; flavors such as strawberry flavor and peppermint and the like. Solid preparations such as capsules, tablets, powders and granules can be prepared by using excipients such as lactose, glucose, sucrose and mannitol; disintegrating agents such as starch and sodium alginate; lubricants such as magnesium stearate and talc; binders such as polyvinyl alcohol, hydroxypropylcellulose and gelatin; surfactants such as fatty acid esters; plasticizers such as glycerin and the like.

[0093] Among the pharmaceutical compositions suitable for parenteral administration, liquid preparations such as injections, drip infusions and eye drops can preferably be prepared as sterilized isotonic liquid preparations. For example, injections can be prepared by using an aqueous medium such as a solution of sodium chloride, a solution of glucose, or a mixture of saline and glucose solution. The intrarectal preparations can be prepared generally in the form of suppositories by using carriers such as cacao butter, hydrogenated fat and hydrogenated carboxylic acid. For the preparation of sprays, a non-irritable carrier can be used that enables fine dispersion and enhances absorption of the aforementioned substances as the active ingredient. Examples of such a carrier include lactose, glycerin and the like. Aerosols, dry powders or the like can also be chosen as the form of preparation. However, pharmaceutical additives used for the manufacture of the medicament of the present invention are not limited to those mentioned above, and any additives available for those skilled in the art can be used.

[0094] A dose and frequency of administration of the medicament of the present invention are not particularly limited, and a suitable dose can be chosen depending on the type and severity of a microbial infection, the presence or absence of an underlying disease, the age and body weight of a patient and the like.

[0095] The first embodiment of the present invention provided from another aspect is a method for judging effectiveness of a drug efflux pump inhibitor against a microorganism, which comprises the steps of:

[0096] (A1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent as a spot on the surface of the agar medium and culturing the microorganism;

[0097] (A2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during culture period;

[0098] (A3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist; and

[0099] (A4) judging that the drug efflux pump inhibitor is effective against the microorganism when the growth degree of the microorganism measured in the step (A2) is significantly higher than the growth degree of the microorganism measured in the step (A3).

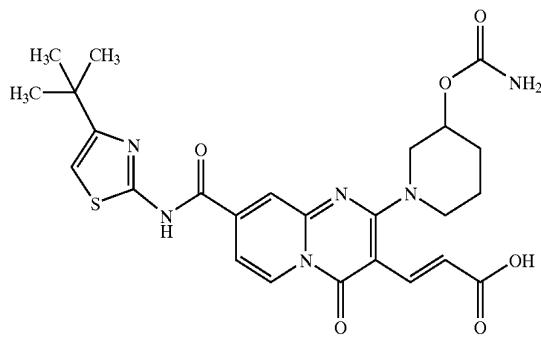

[0100] Type of the agar medium used for the method of the present invention is not particularly limited, and any agar media commonly used for usual antibiotic susceptibility tests may be used. Examples of the agar medium include, for example, an agar medium containing nutrients including a carbon source and a nitrogen source, and specific examples thereof include Mueller-Hinton agar medium (Difco) and the like.

[0101] As the microbial strain, strains isolated from bio-samples collected from patients with infectious diseases and cultured in an ordinary manner, as well as type strains may be used. As the microorganism, *Pseudomonas aeruginosa* is preferred. Method and conditions for spreading the bacterial strain on a surface of the agar medium is not particularly limited, and those used for antibiotic susceptibility tests and the like, per se, may be used. For example, a bacterial strain may be spread on a surface by using the standard method of the Japanese Society of Chemotherapy or the agar plate dilution method defined in NCCLS (National Committee for Clinical Laboratory Standards), preferably, Mueller-Hinton agar medium or the like.

[0102] Although means for providing an antibacterial agent as a spot on the agar medium is not particularly limited, a disk usually used for antibiotic susceptibility tests and the like (circular filter paper impregnated with a medicament) can generally be used. Disks containing various antibacterial agents such as β -lactam antibiotics and quinolone antibacterial agents are commercially available, and medicament-containing disks as commercial products, per se, can be used for the method of the present invention. Further, antibacterial agent containing strips marketed as Etest (registered trademark, AB BIODISK, Sweden) are also preferred. The term "providing as a spot" used in the specification means that an antibacterial agent is provided in an area sufficiently smaller than the surface area of the agar medium. The antibacterial agent is preferably provided as a single spot on the agar medium, or may also be provided as spots at two or more different positions. Further, two or more kinds of antibacterial agents may be provided as spots on the same agar medium. When antibiotic-containing disks are not commercially available, disks may be easily prepared by impregnating an antibiotic solution prepared at a given concentration into filter paper having a suitable size and shape.

[0103] As the drug efflux pump inhibitor, the compounds disclosed in International Patent Publication WO 01/30757 can be used. The entire disclosure of International Patent Publication WO 01/30757 is incorporated herein by reference. Besides the aforementioned compounds, the compounds mentioned in the examples of the specification can also be preferably used. The “drug efflux pump inhibitor” referred to in the present specification means a medicament having an action of inhibiting the function of a drug efflux pump of microorganism, and any medicaments may be used for the method of the present invention so long as they enhance effectiveness of an antibacterial agent on the basis of the aforementioned action.

[0104] When *Pseudomonas aeruginosa* is used as an object of the measurement, it is desirable to select as the drug efflux pump inhibitor an inhibitor for the MexAB-OprM pump, which is constitutively expressed by *Pseudomonas aeruginosa*. As the medicament having an inhibitory activity against excretion activity of the MexAB-OprM pump, the following compound (hereinafter referred to as “Compound A” in the specification) or a derivative thereof is preferably used from viewpoints of potent inhibitory activity and diffusibility on the agar medium surface. This Compound A acts as a specific inhibitor against the MexAB-OprM pump.

[0105] In the method of the present invention, it is necessary to form a region in which the antibacterial agent that has diffused from a disk or the like into the agar medium and the drug efflux pump inhibitor contained in the agar medium coexist. This coexistence state may generally be attained by (i) providing the drug efflux pump inhibitor on the agar medium surface as a spot by means of a disk or the like so that the drug efflux pump inhibitor can diffuse therefrom into the agar medium to form a region in which it exist together with the antibacterial agent that has diffused into the agar medium (region where the diffusions overlap), or (ii) preparing an agar medium added beforehand with the drug efflux pump inhibitor and allowing the antibacterial agent to diffuse into the agar medium from a disk or the like to form a region where the both agents coexist. In the latter embodiment, the disk can be prepared in the same manner as those described above.

[0106] The growth degree of the microorganism in the aforementioned coexistence region can be usually determined by visual inspection of the surface of the agar medium, and an area where no microorganism grows is generally observed as a clear portion. As criteria for the judgment, those adopted in antibiotic susceptibility tests

according to the standard methods of the Japanese Society of Chemotherapy and the like can be used without any modification. When the growth degree of the microorganism measured in the step (A2) is significantly higher than the growth degree of the microorganism measured in the step (A3), the area of the inhibition zone observed in the step (A3) generally becomes larger than the area of the inhibition zone observed in the step (A2) (inhibition zone may sometimes not exist). Therefore, those skilled in the art can easily observe the aforementioned state to conduct the judgment of the step (A4).

[0107] Type of the antibacterial agent used in the aforementioned method is not particularly limited, and any antibacterial agent may be used. Examples include, for example, β -lactam antibiotics (penicillins, cephems, monobactams, carbapenems, penems), aminoglycoside antibiotics, quinolone antibacterial agents, macrolide antibiotics, tetracycline antibiotics, rifamycin antibiotics, chloramphenicol, phosphomycin and the like. However, the antibacterial agents are not limited to these examples. In the aforementioned method, effectiveness of combinational use of two or more kinds of antibacterial agents and drug efflux pump inhibitor can be judged by providing two or more kinds of antibacterial agents each as a spot with a space between the spots, determining a growth degree of the microorganism in a region of the agar medium in which the two or more kinds of antibacterial agents that have diffused during the culture period coexist, similarly determining a growth degree of the microorganism in a region of the agar medium in which the two or more kinds of antibacterial agents and the drug efflux pump inhibitor coexist, and comparing the results obtained.

[0108] The second embodiment of the present invention is a method for identifying a drug efflux pump expressed in a microorganism, which comprises the steps of:

[0109] (B1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent that can be excreted by a particular drug efflux pump as a spot on the surface of the agar medium and culturing the microorganism;

[0110] (B2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during culture period;

[0111] (B3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that the drug efflux pump inhibitor is a specific inhibitor for the particular drug efflux pump); and

[0112] (B4) judging that the microorganism expresses the drug efflux pump of the particular type when the growth degree of the microorganism measured in the step (B2) is significantly higher than the growth degree of the microorganism measured in the step (B3).

[0113] The aforementioned method can be generally used for identification where the microorganism expresses one kind of drug efflux pump. For example, it is known that Aztreonam, which is a β -lactam antibiotic, is excreted by the MexAB-OprM pump constitutively expressed in *Pseudomonas aeruginosa*. When aztreonam is used as an antibacterial agent in the aforementioned method for identification where

the microorganism to be tested expresses the MexAB-OprM pump, the growth degree of the microorganism measured in the step (B2) will significantly exceed the growth degree of the microorganism measured in the step (B3), and hence it can be judged that the microorganism expresses the MexAB-OprM pump. Method for preparation of agar medium, method for providing an antibacterial agent as a spot, method for achieving coexistence with the drug efflux pump inhibitor and the like used in the aforementioned method are the same as those explained above.

[0114] In the aforementioned method, *Pseudomonas aeruginosa* is preferred as the microorganism to be tested. As the antibacterial agent, for example, a β -lactam antibiotic or the like can be used. The β -lactam antibiotic can be suitably selected from those commercially available as therapeutic agents, and β -lactam antibiotics such as penicillin antibiotics, cepham antibiotics, monobactam antibiotics and carbapenem antibiotics can be used. More specifically, penicillin antibiotics, cepham antibiotics, monobactam antibiotics and carbapenem antibiotics such as piperacillin, piperacillin/tazobactam, carbenicillin, ceftazidime, cefepime, aztreonam and meropenem and the like can be used. When *Pseudomonas aeruginosa* is used as a microorganism to be tested, it is preferable to use a β -lactam antibiotic as an antibacterial agent which is more specifically excreted by the MexAB-OprM pump compared with other drug efflux pumps. Aztreonam is a particularly preferred antibacterial agent.

[0115] The third embodiment of the present invention is a method for verifying expression of two or more kinds of drug efflux pumps in a microorganism, which comprises the steps of:

[0116] (C1) spreading a microorganism to be tested on a surface of an agar medium, then providing two or more kinds of antibacterial agents (provided that each of the two or more kinds of the antibacterial agents has different effluxing properties by the two or more kinds of drug efflux pumps, and one of the two or more kinds of the antibacterial agents (hereinafter referred to as "Antibacterial agent (1)") has a property of being excreted by only one of the two or more kinds of the drug efflux pumps (hereinafter referred to as "Drug efflux pump (1)", whilst the other antibacterial agent or agents have a property of being excreted by Drug efflux pump (1) and the other drug efflux pump or pumps);

[0117] (C2) determining a growth degree of the microorganism in a region of the agar medium into which each antibacterial agent has solely diffused during culture period;

[0118] (C3) determining a growth degree of the microorganism in a region of the agar medium in which each antibacterial agent that has solely diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that the drug efflux pump inhibitor is a specific inhibitor for Drug efflux pump (1); and

[0119] (C4) judging that the microorganism expresses Drug efflux pump (1) and one or more kinds of other drug efflux pumps when the growth degree of the microorganism determined in the step (C2) is significantly higher than the growth degree of the microorganism determined in the step (C3) for Antibacterial agent (1) and the growth degree of the microorganism determined in the step (C2) is significantly lower than the growth degree of the microorganism determined in the step (C3) for the other antibacterial agent or agents.

[0120] As the combination of antibacterial agents used in the aforementioned method, a combination of two kinds of antibacterial agents is preferred, and for example, combination of a β -lactam antibiotic and a quinolone antibacterial agent is preferred. β -Lactam antibiotics as those exemplified above can be used as the β -lactam antibiotic. Among them, Aztreonam can be particularly preferably used for the aforementioned method, which is an antibacterial agent specifically excreted only by a MexAB-OprM pump. Further, the quinolone antibacterial agent can be suitably selected from those commercially available as therapeutic agents. For example, Levofloxacin, Ofloxacin, Ciprofloxacin, Norfloxacin and the like can be used. It is known that those quinolone antibiotics are similarly excreted by the MexAB-OprM pump as well as by other Mex type drug efflux pumps (MexCD-OprJ, MexEF-OprN, MexXY and the like), and they can be most preferably used for the aforementioned method. As the drug efflux pump inhibitor, the aforementioned Compound A is most preferably used, which is a specific inhibitor of a MexAB-OprM pump. Method for preparation of agar medium, method for providing an antibacterial agent as a spot, method for achieving coexistence with the drug efflux pump inhibitor and the like used in the aforementioned method are the same as those explained above.

[0121] As an embodiment of the aforementioned method, a method will be specifically explained wherein three kinds of agents including a drug efflux pump inhibitor, β -lactam antibiotic and quinolone antibacterial agent are provided each as a spot on a surface of an agar medium spread with a bacterial strain that is an object of the judgment by using disks, for example, as a means for provision as spots. However, the method of the present invention is not limited to the specific embodiment.

[0122] Amounts of the β -lactam antibiotic, quinolone antibacterial agent, and drug efflux pump inhibitor provided each as a spot are not particularly limited, and the amounts can be suitably selected considering diffusibility of each agent on a surface of agar medium and culture time (diffusion time) as well as strength of the inhibitory effect against the drug efflux pump. For example, when Aztreonam is used as the β -lactam antibiotic, its amount provided as a spot is suitably in the range of 10-30 μ g, and when Levofloxacin is used as the quinolone antibiotic, its amount provided as a spot is suitably in the range of 1-10 μ g. When the aforementioned Compound A is used as the drug efflux pump inhibitor, its amount provided as a spot is suitably in the range of 50-100 μ g. However, the amounts to be provided as spots may optionally be increased or decreased depending on the type of microbial strain, which is an object of the measurement, shapes and sizes of inhibition zones formed around the β -lactam antibiotic and quinolone antibacterial agent and the like.

[0123] Positions of the β -lactam antibiotic and quinolone antibacterial agent provided as spots are not particularly limited. Preferred positions may give overlap of an area where either of the β -lactam antibiotic or the quinolone antibacterial agent diffuses in the agar medium during the culture period with an area where the drug efflux pump inhibitor diffuses in the agar medium, and also give no overlap of an area where the β -lactam antibiotic diffuses during the culture period with an area of the agar medium where the quinolone antibiotic diffuses during the culture

period. It is generally preferred that the two antibacterial agents are bilaterally provided between which the drug efflux pump inhibitor is provided.

[0124] Diffusion areas of the β -lactam antibiotic, quinolone antibacterial agent and drug efflux pump inhibitor generally change depending on factors including type of each antibacterial agent, amount of agent provided as a spot, type of medium, culture conditions (mainly culture time) and the like. Accordingly, the diffusion areas can suitably be controlled by appropriately controlling these factors. For example, the distance between the β -lactam antibiotic and the drug efflux pump inhibitor and the distance between the quinolone antibacterial agent and the drug efflux pump inhibitor are preferably each in the range of about 1-3 cm. Inhibition zone may be formed by each of the β -lactam antibiotic and quinolone antibacterial agent alone as a control. For that purpose, they can be independently provided each as a spot at such positions that the agents diffused from the disks of the β -lactam antibiotic and quinolone antibacterial agent give no overlap.

[0125] Conditions of the culture on the agar medium on which surface the β -lactam antibiotic, quinolone antibacterial agent and drug efflux pump inhibitor are placed are not particularly limited, and they can be suitably selected depending on the conditions including type of the microorganism, kind of the agar medium, diffusion area of each antibacterial agents and the like. For example, the culture can be performed at a temperature of 35-37° C. for 12-36 hours. During the culture, the β -lactam antibiotic, quinolone antibacterial agent and drug efflux pump inhibitor placed on the surface of agar medium diffuse in the surface and inside the agar medium.

[0126] As an example of the method of the present invention, standards for judging properties of a microbial strain based on information obtained after culture are explained below as for a test where *Pseudomonas aeruginosa* constitutively expressing an MexAB-OprM pump is used as an object of the measurement, Aztreonam (specifically excreted only by the MexAB-OprM pump) as a β -lactam antibiotic and Levofloxacin (excreted by a MexAB-OprM pump and other Mex type drug efflux pumps) as a quinolone drug are used as antibacterial agents, Compound A that is a specific inhibitor to a MexAB-OprM pump is used as the drug efflux pump inhibitor, and disks containing each agent are provided on an agar medium. However, the method of the present invention is not limited to the aforementioned specific embodiment.

[0127] (1) Where Bacterial Strain is *Pseudomonas aeruginosa* that Expresses MexAB-OprM Pump

[0128] This bacterial strain has resistance to both of Aztreonam as a β -lactam antibiotic and Levofloxacin as a quinolone antibiotic on the basis of excretion of the agents by a MexAB-OprM pump. Therefore, at a position where the diffusion area of Aztreonam or Levofloxacin and that of Compound A as a specific inhibitor for a MexAB-OprM pump give no overlap (only either of Aztreonam or Levofloxacin exists at this position), any inhibition zone is not observed or only a small concentric inhibition zone proximate to the disk is observed. This is because almost no inhibition or absolutely no inhibition of the growth of the cells is achieved solely by Aztreonam or Levofloxacin due to excretion of the antibacterial agents by the action of the MexAB-OprM pump.

[0129] Whilst, around Aztreonam or Levofloxacin at a position where the diffusion areas of Aztreonam or Levofloxacin and the diffusion area of Compound A give overlap, a large inhibition zone is observed. This is because the drug excretion action of the MexAB-OprM pump is inhibited by Compound A as a MexAB-OprM pump inhibitor, and as a result, Aztreonam or Levofloxacin penetrates into the cells to enable inhibition of cell growth by the antibacterial activity of each antibacterial agent. Shape of the inhibition zone observed may change depending on the degree of overlap of the diffusion area of Aztreonam or Levofloxacin and that of Compound A. Further, size of the inhibition zone may also change depending on the expression amount of the MexAB-OprM pump. When a bacterial strain expresses a larger amount of the MexAB-OprM pump, the formation of the inhibition zone is enhanced. However, in each any case, the resulting inhibition zone can be clearly distinguished, based on the difference in diameter of the inhibition zones, from the inhibition zone formed around Aztreonam or Levofloxacin (inhibition zone may sometimes not be formed) at a position where diffusion area thereof gives no overlap with that of Compound A.

[0130] (2) Where Bacterial Strain is *Pseudomonas aeruginosa* Coexpressing Another Drug Efflux Pump in Addition to MexAB-OprM Pump

[0131] In addition to the MexAB-OprM pump constitutively expressed in *Pseudomonas aeruginosa*, MexCD-OprJ pump, MexEF-OprN pump, MexXY pump and the like are known, for example, which are Mex drug efflux pumps. Further, bacterial strains expressing two or more kinds of pumps among the Mex pumps are also known. For strains with said pumps, an antibiotic susceptibility test in which only a β -lactam antibiotic or a quinolone antibacterial agent is used and no MexAB-OprM pump inhibitor is used in combination fails to clarify expression amount of the MexAB-OprM pump or existence of Mex pump expressed in addition to the MexAB-OprM pump. Whilst the method of the present invention will provide distinctive results.

[0132] When the objective *Pseudomonas aeruginosa* expresses another Mex pump in addition to the MexAB-OprM pump, such a strain has resistance to both of Aztreonam and Levofloxacin by the synergistic excretion action of the MexAB-OprM pump and the other Mex pump. Therefore, at a position where the diffusion area of Aztreonam or Levofloxacin and that of Compound A give no overlap (only Aztreonam or Levofloxacin exists at this position), no inhibition zone is observed or only a small concentric inhibition zone proximate to the disk is formed.

[0133] Further, at a position where the diffusion area of Levofloxacin and that of Compound A give overlap, no formation of inhibition zone is observed or only a small inhibition zone is observed around Levofloxacin. This is because Levofloxacin cannot sufficiently penetrate into the cells due to excretion by the Mex pump other than the MexAB-OprM pump, and as a result, the agent becomes impossible to inhibit the growth of the bacterium.

[0134] Whilst, at a position where the diffusion area of Aztreonam and that of Compound A give overlap, a large inhibition zone is formed around the β -lactam antibiotic. The reason can be explained as follows. Compound A as a MexAB-OprM pump inhibitor specifically inhibits only the MexAB-OprM pump, and the agent cannot inhibit another

Mex pump if it is expressed. However, Aztreonam as a β -lactam antibiotic that is excreted only by the MexAB-OprM pump is not excreted by the Mex pump other than the MexAB-OprM pump. Therefore, when the MexAB-OprM pump is inhibited by Compound A, Aztreonam penetrates into the cells and inhibits the growth of the cells on the basis of its antibacterial activity.

[0135] The present invention was generally explained above, and the method of the present invention will be more specifically explained in the examples of the present specification. Therefore, those skilled in the art can practice the method of the present invention by adding suitable modifications or alterations to the method as required based on the above general descriptions and specific explanations in the examples. It should be understood that those methods added with such modifications or alterations also fall within the scope of the present invention.

EXAMPLES

[0136] The present invention will be explained more specifically with reference to the examples. However, the scope of the present invention is not limited to the following examples.

Example 1

(E)-3-[8-[2-(4-Cyclobutyl-1,3-thiazol-2-yl)ethyl]-2-(3-hydroxypiperidino)-4-oxo-4H-pyrido[1,2-a]pyrimidin-3-yl]-2-propenoic acid

[0137] (A) Methyl 3-{2-[(tert-butoxycarbonyl)amino]-4-pyridyl}propanoate

[0138] tert-Butyl N-(4-methyl-2-pyridyl)carbamate (5 g, 24.0 mmol) was dissolved in tetrahydrofuran (120 ml), cooled to -78°C., and then added dropwise with n-butyl lithium (40 ml, 60 mmol). Then, the reaction solution was warmed and stirred at room temperature. The reaction mixture was stirred for 1 hour, then again cooled to -78°C., and added dropwise with methyl bromoacetate (3.4 ml) dissolved in tetrahydrofuran (10 ml). After the reaction mixture was stirred for 30 minutes, the reaction was stopped with saturated brine and the reaction mixture was extracted with ethyl acetate. The resulting organic layer was dried over sodium sulfate and concentrated under reduced pressure, and the residue was purified by silica gel column chromatography (chloroform:ethyl acetate=3:1→5:1) to obtain 3.95 g (59%) of the title compound as pale yellow crystals.

[0139] $^1\text{H-NMR}$ (CDCl_3) δ : 1.53 (9H, s), 2.67 (2H, t, $J=7.81\text{Hz}$), 2.95 (2H, t, $J=7.81\text{Hz}$), 3.68 (3H, s), 6.82 (1H, dd, $J=1.22$, 5.13Hz), 7.84 (1H, s), 8.13 (1H, d, $J=5.13\text{Hz}$)

[0140] (B) 3-{2-[(tert-Butoxycarbonyl)amino]-4-pyridyl}propanoic acid

[0141] Methyl 3-{2-[(tert-butoxycarbonyl)amino]-4-pyridyl}propanoate (30.65 g, 0.11 mol) dissolved in methanol (200 ml) was added with 1 N aqueous sodium hydroxide (164 ml) and stirred at room temperature for 21 hours. After the solvent was evaporated under reduced pressure and the residue was washed with diethyl ether, the resulting aqueous layer was added with concentrated hydrochloric acid until pH of the layer became 1. The solution was washed with ethyl acetate, and the resulting aqueous layer was neutralized by further adding sodium hydroxide. The solution was

extracted with chloroform:methanol=10:1, and the resulting organic layer was dried over sodium sulfate and concentrated under reduced pressure to obtain 11.16 g (38%) of the title compound as yellow crystals without purification.

[0144] (C) tert-Butyl N-[4-(3-amino-3-oxopropyl)-2-pyridyl]carbamate

[0145] 3-{2-[(tert-Butoxycarbonyl)amino]-4-pyridyl}propanoic acid (11.16 g, 41.92 mmol) dissolved in tetrahydrofuran (200 ml) was added with triethylamine (9 ml, 62.89 mmol), cooled with ice, and then added dropwise with ethyl chloroformate (6 ml, 62.89 mmol). The reaction mixture was stirred for 10 minutes, and then added with aqueous ammonia (50 ml) dissolved in tetrahydrofuran (50 ml) at 0°C. The reaction mixture was stirred for 20 minutes under ice cooling, and then the solvent was evaporated under reduced pressure. The resulting residue was washed with water and extracted with chloroform. The resulting organic layer was washed with saturated brine, and the organic layer was dried over sodium sulfate and concentrated under reduced pressure to obtain 11.794 g (100%) of the title compound as brown crystals without purification.

[0146] $^1\text{H-NMR}$ (CD_3OD) δ : 1.53 (9H, s), 2.57 (2H, t, $J=8.05\text{Hz}$), 2.97 (2H, t, $J=8.05\text{Hz}$), 5.40 (2H, br), 6.84 (1H, dd, $J=1.46$, 5.13Hz), 7.83 (1H, s), 8.13 (1H, d, $J=5.13\text{Hz}$)

[0148] (D) tert-Butyl N-[4-(3-amino-3-thioxopropyl)-2-pyridyl]carbamate

[0149] Under argon atmosphere, tert-butyl N-[4-(3-amino-3-oxopropyl)-2-pyridyl]-carbamate (11.79 g, 44.44 mmol) dissolved in tetrahydrofuran (100 ml) was added with Lawesson's reagent (9 g, 22.22 mmol) and stirred at 70-80°C. for 30 minutes. After the reaction mixture was returned to room temperature, the solvent was evaporated under reduced pressure and the resulting residue was purified by silica gel column chromatography (chloroform→chloroform:methanol=20:1) to obtain 9.544 g (76%) of the title compound as pale yellow crystals.

[0150] $^1\text{H-NMR}$ (CD_3OD) δ : 1.53 (9H, s), 2.89 (2H, t, $J=8.30\text{Hz}$), 3.09 (2H, t, $J=8.30\text{Hz}$), 6.94 (1H, d, $J=5.13\text{Hz}$), 7.75 (1H, s), 8.08 (1H, d, $J=5.13\text{Hz}$)

[0151] EI/MS; m/z: 282 ($\text{M}^{+}+1$)

[0152] (E) 2-Bromo-1-cyclobutyl-1-ethanone

[0153] 1-Cyclobutyl-1-ethanone (500 mg, 5.1 mmol) dissolved in methanol (5 ml) was added with bromine (0.3 ml, 5.6 mmol) and stirred at room temperature for 1 hour. The resulting ocher reaction mixture was added with water (3 ml) under ice cooling, and then gradually added with potassium carbonate (350 mg). The mixture was extracted with dichloromethane, and the resulting organic layer was neutralized with saturated aqueous sodium hydrogencarbonate and washed with saturated brine. The resulting organic layer was dried over magnesium sulfate and concentrated under reduced pressure to obtain 867 mg (96%) of the title compound without purification.

[0154] $^1\text{H-NMR}$ (CDCl_3) δ : 1.88 (1H,m), 2.00 (1H,m), 2.20-2.37 (4H,m), 3.60 (1H, qu, $J=8.53\text{Hz}$), 3.88 (2H, s)

[0155] (F) 8-[2-(4-Cyclobutyl-1,3-thiazol-2-yl)ethyl]-2-hydroxy-4H-pyrido[1,2-a]pyrimidin-4-one

[0156] tert-Butyl N-[4-(3-amino-3-thioxopropyl)-2-pyridyl]carbamate (1.38 g, 4.9 mmol) dissolved in ethanol was added with 2-bromo-1-cyclobutyl-1-ethanone (867 mg, 4.9 mmol) and refluxed at 100°C . for 1 hour. The resulting reaction solution was cooled to room temperature, then neutralized with saturated aqueous sodium hydrogencarbonate and extracted with chloroform. The resulting organic layer was washed with saturated brine, dried over magnesium sulfate and concentrated under reduced pressure.

[0157] The resulting oily compound was added with dichloromethane (50 ml) and slowly added dropwise with trifluoroacetic acid (50 ml) under ice cooling. Then, the reaction solution was warmed to room temperature and stirred 1 hour. The resulting solution was neutralized with saturated sodium hydrogencarbonate and extracted with chloroform. The organic layer was washed with saturated brine, and the resulting organic layer was dried over magnesium sulfate and concentrated under reduced pressure.

[0158] The brown oily residue (1.37 g) was added with xylene (7 ml) and trichlorophenyl malonate (2.7 g, 5.83 mmol) and refluxed by heating at 140°C . for 1 hour, and the solvent was evaporated under reduced pressure. The resulting oily compound was purified by silica gel chromatography (ethyl acetate \rightarrow chloroform:methanol=30:1 \rightarrow 10:1 \rightarrow 5:1) to obtain 657 mg (41% for the three steps) of the title compound as pale yellow crystals.

[0159] $^1\text{H-NMR}$ (CDCl_3) δ : 1.91 (1H,m), 2.01 (1H, qu, $J=8.79\text{Hz}$), 2.22 (2H, d qu, $J=2.44$, 8.79Hz), 2.34 (2H, tq, $J=2.44$, 8.79Hz), 3.39 (4H, dd, $J=6.84$, 20.75Hz), 3.63 (1H, qu, $J=8.79\text{Hz}$), 5.33 (1H, s), 6.76 (1H, s), 7.11 (1H, dd, $J=1.71$, 7.08Hz), 7.40 (1H, s), 9.02 (1H, d, $J=7.08\text{Hz}$)

[0160] (G) 8-[2-(4-Cyclobutyl-1,3-thiazol-2-yl)ethyl]-2-(3-hydroxypiperidino)-4H-pyrido[1,2-a]pyrimidin-4-one

[0161] 8-[2-(4-Cyclobutyl-1,3-thiazol-2-yl)ethyl]-2-hydroxy-4H-pyrido[1,2-a]pyrimidin-4-one (120 mg, 0.366 mmol) dissolved in tetrahydrofuran (4 ml) and dimethylformamide (1 ml) was added with 4-dimethylaminopyridine (60 mg, 0.475 mmol) and p-toluenesulfonyl chloride (77 mg, 0.402 mmol) at room temperature and stirred for 30 minutes. The solvent was evaporated under reduced pressure, and the residue was washed with water and extracted with chloroform. The resulting organic layer was dried over magnesium sulfate and concentrated under reduced pressure.

[0162] The resulting oily compound was added with dimethylformamide (3 ml) and 3-hydroxypiperidine (45 mg, 0.44 mmol), and stirred at 60°C . for 40 hours. The solvent was evaporated under reduced pressure, and then the residue was purified by silica gel column chromatography (chloroform \rightarrow chloroform:methanol=20:1) to obtain 103 mg (68% for the two steps) of the title compound as oil.

[0235] (A) 4-Methoxy-2-pyridinecarbonitrile

[0236] 4-Methoxypyridine-N-oxide hydrate (1 g, 6.99 mmol) dissolved in dichloromethane (4 ml) was added with trimethylsilyl cyanide (1 ml, 7.69 mmol) and subsequently added dropwise with N,N-dimethylcarbamoyl chloride (0.8 ml, 9.09 mmol) under ice cooling. The reaction solution was warmed to room temperature, stirred for 1 hour, and then added further with trimethylsilyl cyanide (0.2 ml, 1.40 mmol). The reaction solution was stirred for 19 hours, then added with 10% potassium carbonate (2 ml). The mixture was diluted with ethyl acetate, washed with saturated brine and dried over magnesium sulfate, and then concentrated under reduced pressure. The resulting crystals were washed with hexane to obtain 560 mg (60%) of the title compound as pink crystals without purification.

[0237] $^1\text{H-NMR}$ (CDCl_3) δ : 3.92 (3H, s), 7.02 (1H, dd, $J=2.44$, 5.86Hz), 7.22 (1H, d, $J=2.44\text{Hz}$), 8.51 (1H, d, $J=5.86\text{Hz}$)

[0238] (B) 4-Hydroxy-2-pyridinecarbonitrile

[0239] 4-Methoxy-2-pyridinecarbonitrile (544 mg, 4.055 mmol) was added with 47% hydrobromic acid (6 ml) and

refluxed by heating at 130° C. The reaction solution was stirred for 22 hours, returned to room temperature, and then concentrated under reduced pressure. The residue was subjected to azeotropy with toluene and diethyl ether to remove excessive hydrobromic acid. The resulting white crystals were washed with diethyl ether to obtain 1.47 g of the title compound containing hydrogen bromide without purification.

[0240] $^1\text{H-NMR}$ (CD_3OD) δ : 7.48 (1H, dd, $J=2.44, 6.83\text{Hz}$), 7.81 (1H, d, $J=2.44\text{Hz}$), 8.63 (1H, d, $J=6.83\text{Hz}$)

[0241] (C) Ethyl 4-hydroxy-2-pyridinecarboxylate

[0242] 4-Hydroxy-2-pyridinecarbonitrile (25.48 g, 0.2121 mol) dissolved in ethanol (400 ml) was added with concentrated hydrochloric acid (40 ml) and refluxed by heating at 110° C. for 6 days. The reaction solution was returned to room temperature, evaporated under reduced pressure and added with chloroform:methanol=20:1. After insoluble crystals were removed by filtration, the resulting filtrate was concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (chloroform:methanol=20:1→10:1) to obtain 22.4 g (63% for the two steps) of the title compound as yellow crystals.

[0243] $^1\text{H-NMR}$ (CD_3OD) δ : 1.32 (3H, t, $J=7.32\text{Hz}$), 4.52 (2H, q, $J=7.32\text{Hz}$), 7.18 (1H, dd, $J=2.69, 6.84\text{Hz}$), 7.58 (1H, d, $J=2.69\text{Hz}$), 8.36 (1H, d, $J=6.84\text{Hz}$)

[0245] (D) 2-(Chloromethyl)-4-isopropyl-1,3-thiazole

[0246] (4-Isopropyl-1,3-thiazol-2-yl)methanol (10 g, 63.6011 mmol) dissolved in dichloromethane (60 ml) was added with thionyl chloride (7 ml, 95.40 mmol) under ice cooling, and then the reaction solution was returned to room temperature and stirred for 20 minutes. The reaction solution was concentrated under reduced pressure, and the residue was subjected to azeotropy with toluene and then diluted with diethyl ether, and further neutralized with saturated aqueous sodium hydrogencarbonate. The organic layer was washed with saturated brine, then dried over magnesium sulfate and concentrated under reduced pressure. The title compound was obtained as the residue without purification (11 g, 100%).

[0249] (E) Ethyl 4-[4-isopropyl-1,3-thiazol-2-yl]methoxy]-2-pyridinecarboxylate

[0250] Ethyl 4-hydroxy-2-pyridinecarboxylate (19.5 g, 0.057 mol) dissolved in dimethylformamide (200 ml) was added with a solution of 2-(chloromethyl)-4-isopropyl-1,3-thiazole (11 g, 0.063 mol) in dimethylformamide (150 ml). The mixture was added with potassium iodide (9.5 g) and potassium carbonate (12 g) at room temperature, then heated to 110° C. and stirred for 1 hour. The reaction solution was returned to room temperature, and the solvent was evaporated under reduced pressure. The residue was diluted with chloroform and washed with water. The resulting organic layer was washed with saturated brine, and the organic layer was dried over magnesium sulfate and concentrated under

reduced pressure. The residue was purified by silica gel chromatography (chloroform) to obtain 8.049 g (46%) of the title compound.

[0251] $^1\text{H-NMR}$ (CDCl_3) δ : 1.32 (6H, d, $J=6.86\text{Hz}$), 1.44 (3H, t, $J=7.10\text{Hz}$), 3.12 (1H, qu, $J=6.86\text{Hz}$), 4.47 (2H, q, $J=7.10\text{Hz}$), 5.44 (2H, s), 6.94 (1H, s), 7.09 (1H, dd, $J=2.694, 5.63\text{Hz}$), 7.80 (1H, d, $J=2.694\text{Hz}$), 8.58 (1H, d, $J=5.63\text{Hz}$)

[0253] (F) 4-[(4-Isopropyl-1,3-thiazol-2-yl)methoxy]-2-pyridinecarboxylic acid

[0254] Ethyl 4-[4-isopropyl-1,3-thiazol-2-yl)methoxy]-2-pyridinecarboxylate (7.44 g, 24.28 mmol) dissolved in ethanol (50 ml) was added dropwise with 1 N sodium hydroxide (27 ml, 26.70 mmol) at room temperature, and stirred at room temperature for 1 hour and 30 minutes. The solvent was evaporated under reduced pressure, and the resulting Na salt crystals were washed with ethyl acetate.

[0255] The crystals were added with 4 N hydrochloric acid (27 ml) and 1,4-dioxane (40 ml), stirred and concentrated under reduced pressure. The residue was subjected to azeotropy with toluene, and the solvent was completely evaporated. The resulting crystals were filtered with chloroform:methanol=10:1, and the filtrate was concentrated under reduced pressure. The resulting pale yellow crystals were purified by silica gel column chromatography (chloroform:methanol=20:1→10:1→5:1) to obtain 6.7 g (100%) of the title compound as white crystals.

Example 6

(E)-3-{8-[2-(4-Ethyl-2-thienyl)ethyl]-2-morpholino-4-oxo-4H-pyrido[1,2-a]pyrimidin-3-yl}-2-propanoic acid

[0285] (A) 4-Ethyl-2-thiophenecarbaldehyde

[0286] 3-Ethylthiophene (2 g, 17.8 mmol) dissolved in diethyl ether (18 ml) was added with a solution of n-butyl lithium in hexane (1.5 M, 14 ml, 21.4 mmol) at room temperature and refluxed by heating at 60°C . for 15 minutes. The reaction solution was returned to room temperature and added dropwise with dimethylformamide (2

ml, 23.2 mmol) dissolved in diethyl ether. After the reaction solution was stirred for 2 hours at room temperature, the reaction was stopped with saturated aqueous ammonium chloride, and the reaction solution was extracted with chloroform. The collected organic layer was washed with saturated brine, then dried over magnesium sulfate and concentrated under reduced pressure.

[0287] The residue was purified by silica gel column chromatography (hexane:ethyl acetate=20:1→10:1) to obtain 2 g (80%) of the title compound.

[0288] $^1\text{H-NMR}$ (CDCl_3) δ : 1.27 (3H, t, $J=7.59\text{Hz}$), 2.68 (2H, q, $J=7.59\text{Hz}$), 7.39 (1H, s), 7.63 (1H, s), 9.87 (1H, s)

[0289] (B) (4-Ethyl-2-thienyl)methanol

[0290] 4-Ethyl-2-thiophenecarbaldehyde (1 g, 7.13 mmol) dissolved in methanol (7 ml) was added with sodium borohydride (135 mg, 3.57 mmol) under ice cooling, stirred for 10 minutes and then further added with sodium borohydride (150 mg, 3.96 mmol) at 0° C. After the reaction solution was stirred under ice cooling for 30 minutes, the reaction was stopped with saturated aqueous ammonium chloride and the reaction solution was extracted with chloroform. The organic layer collected was dried over magnesium sulfate and concentrated under reduced pressure to obtain 1 g (100%) of the title compound without purification.

[0291] $^1\text{H-NMR}$ (CDCl_3) δ : 1.22 (3H, t, $J=7.56\text{Hz}$), 2.59 (2H, q, $J=7.56\text{Hz}$), 4.75 (2H, s), 6.86 (2H, s)

[0292] (C) tert-Butyl N-{4-[2-(3-bromo-4-ethyl-2-thienyl)ethyl]-2-pyridyl}carbamate (4-Ethyl-2-thienyl)methanol (1 g, 7.03 mmol) dissolved in dichloromethane (7 ml) was added with thionyl bromide (0.8 ml, 10.55 mmol) under ice cooling and then warmed to room temperature. The reaction solution was stirred for 20 minutes and then concentrated under reduced pressure, and the residue was neutralized by adding saturated aqueous sodium hydrogencarbonate and extracted with diethyl ether. The organic layer was washed with saturated brine, dried over magnesium sulfate and concentrated under reduced pressure. The residue was used in the subsequent reaction without purification.

[0293] tert-Butyl N-(4-methyl-2-pyridyl)carbamate (800 mg, 3.84 mmol) dissolved in tetrahydrofuran (15 ml) was cooled to -78° C. and then added dropwise with a solution of n-butyl lithium in hexane (1.5 M, 6.4 ml, 9.6 mmol). The reaction solution was stirred at room temperature for 1 hour, then cooled to -78° C. again and added dropwise with a solution of the above obtained 3-bromo-2-(bromomethyl)-4-ethylthiophene in tetrahydrofuran (14 ml). After the reaction solution was stirred at -78° C. for 1 hour and the reaction was stopped with saturated brine, the reaction solution was extracted with ethyl acetate. The organic layer collected was dried over magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (chloroform) to obtain 1.3 g (85%) of the title compound.

[0303] (F) 8-[2-(4-Ethyl-2-thienyl)ethyl]-2-hydroxy-4H-pyrido[1,2-a]pyrimidin-4-one

[0304] 8-[2-(3-Bromo-4-ethyl-2-thienyl)ethyl]-2-hydroxy-4H-pyrido[1,2-a]pyrimidin-4-one (96 mg, 0.25 mmol) dissolved in toluene (6 ml) was added with tributyltin hydride (75 μl) and 2,2-azobisisobutyronitrile (4 mg, 0.025 mmol) and refluxed by heating at 140° C. Then 2,2-azobisisobutyronitrile and tributyltin hydride were further added until the reaction was completed while the progress of the reaction was monitored by LC-MS. 34 mg (0.22 mmol) of 2,2-azobisisobutyronitrile and 350 μl (1.30 mmol) of tributyltin hydride were used. The reaction solution was returned to room temperature and the reaction was stopped with an aqueous solution of potassium fluoride. The reaction solution was extracted with ethyl acetate, and the organic layer was washed with saturated brine. Then, the aqueous layer was extracted with ethyl acetate. The organic layer collected was dried over magnesium sulfate and concentrated under reduced pressure. The residue was purified by thin layer silica gel chromatography (chloroform:methanol=20:1) to obtain 119 mg of the title compound with contained impurities.

[0680] The 2-[2-(4-methoxybenzyl)-2H-1,2,3,4-tetrazol-5-yl]ethanoyl chloride (0.27 g, 1.05 mmol) obtained in (C) was dissolved in methylene chloride (3 ml), added dropwise with pyridine (170.2 μl , 2.10 mmol) under ice cooling, and added dropwise with a solution of 8-[2-(4-isopropyl-1,3-thiazol-2-yl)ethyl]-2-morpholino-4H-pyrido[1,2-a]pyrimidin-4-one (80.9 mg, 0.21 mmol) in methylene chloride (3 ml). The reaction solution was stirred at room temperature for 23 hours, then further added with a solution of 2-[2-(4-methoxybenzyl)-2H-1,2,3,4-tetrazol-5-yl]ethanoyl chloride (0.27 g, 1.05 mmol) in methylene chloride (2 ml) and pyridine (170.2 μl , 2.10 mmol) under ice cooling. Further, the reaction solution was added with the same amounts of the acid chloride and pyridine twice every 24 hours, and stirred at room temperature. The solvent was evaporated, and the residue was added with saturated aqueous sodium hydrogencarbonate and extracted with ethyl acetate. The organic layer was washed with saturated brine and dried over anhydrous sodium sulfate. The solvent was evaporated and the residue was purified by preparative TLC (hexane:ethyl acetate=1:1, v/v and chloroform:methanol=30:1, v/v) to obtain the title compound (10.1 mg, 7.8%) as yellow oil.

[0832] (B) tert-Butyl N-4-[2-hydroxy-2-(4-isopropyl-1,3-thiazol-2-yl)ethyl]-2-pyridylcarbamate

[0833] tert-Butyl N-(4-methyl-2-pyridyl)carbamate (6.24 g, 30.0 mmol) was dissolved in anhydrous tetrahydrofuran (100 ml), added with n-butyl lithium (1.59 M in n-hexane, 47.1 ml, 74.9 mmol) at -78° C. under argon atmosphere, and then stirred at room temperature for 1.5 hours. The reaction solution was cooled to -78° C. again, then added with a solution of the 4-isopropyl-1,3-thiazole-2-carbaldehyde (4.65 g, 30.0 mmol) obtained in (A) in anhydrous tetrahydrofuran (50.0 ml), and then the mixture was stirred for 3 hours. The reaction mixture was added with saturated aque-

ous ammonium chloride, warmed to room temperature, and then extracted with ethyl acetate. The organic layer was dried over magnesium sulfate, and the solvent was evaporated under reduced pressure. The residue was purified by silica gel column chromatography (n-hexane:ethyl acetate=3:1→1:1, v/v) to obtain the title compound (5.42 g, 50%).

[0837] The tert-butyl N-4-[2-hydroxy-2-(4-isopropyl-1,3-thiazol-2-yl)ethyl]-2-pyridylcarbamate (5.30 g, 14.6 mmol) obtained in (B) was dissolved in anhydrous tetrahydrofuran (100 ml), added with triethylamine (5.08 ml, 36.5 mmol) and methanesulfonyl chloride (1.35 ml, 17.5 mmol), and then the mixture was stirred at room temperature for 1 hour. After insoluble solids were removed, the reaction solution was washed with tetrahydrofuran, and the solvent was evaporated under reduced pressure. The residue was dissolved in toluene (100 ml), added with 1,8-diazabicyclo [5.4.0]undec-7-ene (10.9 ml, 72.9 mmol), and refluxed by heating for 30 minutes. The reaction solution was concentrated, then added with 1 N hydrochloric acid and extracted with chloroform. The organic layer was washed with saturated aqueous sodium hydrogencarbonate and dried over magnesium sulfate, and the solvent was evaporated under reduced pressure. The residue was purified by silica gel column chromatography (n-hexane:ethyl acetate=5:1→3:1, v/v) to obtain the title compound (3.76 g, 75%).

[1188] [(4-Isopropyl-1,3-thiazol-2-yl)methyl](triphenylphosphonium bromide (723 mg, Chem. Pharm. Bull., 1977, 25, 349-352) was suspended in tetrahydrofuran (20 ml), added dropwise with n-butyl lithium (1.6 M, 1.2 mmol) at -20°C . under nitrogen atmosphere, and stirred at the same temperature for 20 minutes. The reaction mixture was added with a solution of ethyl 1-ethyl-7-formyl-4-oxo-1,4-dihydro-[1,8]naphthylidine-3-carboxylate (316 mg) dissolved in tetrahydrofuran, and stirred for 2 hours. The reaction mixture was added with saturated aqueous ammonium chloride and extracted with ethyl acetate. After the organic layer was dried, the solvent was evaporated under reduced pressure. The residue was purified by silica gel column chromatography to obtain the title compound (456 mg).

5-yl]-1-ethenyl}-4-oxo-4H-pyrido[1,2-a]pyrimidine-8-carboxamide (106.3 mg, 0.19 mmol) was suspended in acetonitrile (3 ml) and DMF (3 ml), added dropwise with diphenyl chlorophosphate (79.0 μ l, 0.38 mmol) and diisopropylethylamine (132.6 μ l, 0.76 mmol) at -10° C. under argon atmosphere, stirred at the same temperature for 15 minutes, then added dropwise with a solution of N¹-[(3S)-hexahydro-3-pyridinyl]-2-(dimethylamino)acetamide (70.5 mg, 0.38 mmol) in DMF (1 ml) and diisopropylethylamine (66.3 μ l, 0.38 mmol) and heated to 80° C. for 1 hour with stirring. The reaction solution was added with a solution of N¹-[(3S)-hexahydro-3-pyridinyl]-2-(dimethylamino)acetamide (70.5 mg, 0.38 mmol) in DMF (1 ml) and diisopropylethylamine (66.3 μ l, 0.38 mmol), further heated to 80° C. for 1 hour with stirring and then cooled. The reaction mixture was added with saturated aqueous sodium hydrogencarbonate and extracted with chloroform. The resulting organic layer was washed with saturated brine and dried over anhydrous sodium sulfate, and the solvent was evaporated. The residue was purified by preparative TLC (chloroform:methanol=10:1) to obtain the title compound (111.5 mg, 80.7%) as yellow orange oily substance.

hours. The solvent and excessive reagents were evaporated, and the residue was subjected to azeotropy with toluene and ether. The residue was purified by preparative TLC (chloroform:methanol:water=8:3:0.1) to obtain 481.6 mg of carboxylic acid compound as a mixture of orange oily substance and foamy substance.

[1556] This compound was dissolved in TFA (100 ml), heated to 60° C. for 2 hours with stirring and cooled. Then TFA was evaporated, and the residue was subjected to azeotropy with toluene and ether and purified by preparative TLC (chloroform:methanol:water=8:3:0.5). The product was substantially dissolved in water, neutralized by adding 1 N aqueous sodium hydroxide, loaded on HP-20 (washed with water and then eluted with methanol:water=7:3) for desalting. The residue was purified by HPLC, powdered by addition of ether and centrifuged. The supernatant was removed, and the residue was dried under reduced pressure to obtain the title compound (96.0 mg, 30.8% for the two steps) as orange powder.

[1816] A mixed solution of dimethylformamide (1.67 ml, 21.8 mmol) and methylene chloride (50 ml) was added with oxalyl chloride (1.86 ml, 21.8 mmol) with ice cooling and stirred for 25 minutes. This solution was added with N⁸-[4-(t-butyl)-1,3-thiazol-2-yl]-2,4-dioxo-3,4-dihydro-2H-pyrido[1,2-a]pyrimidine-8-carboxamide (3.00 g, 8.71 mmol) and methylene chloride (20 ml), stirred at room temperature for 1 hour and added with saturated aqueous sodium hydrogen-carbonate to terminate the reaction. The resulting solution was adjusted to about pH 3 with 1 N aqueous hydrochloric acid. This solution was extracted with chloroform (10 times), and the combined organic layer was concentrated under reduced pressure.

[1817] The resulting residue, 2-[1-(4-methoxybenzyl)-1H-1,2,3,4-tetrazol-5-yl]acetic acid (3.25 g, 13.1 mmol), was dissolved in a mixed solution of piperidine (30 ml) and pyridine (200 ml) and refluxed by heating for 3 hours. The reaction mixture was cooled to room temperature, concen-

trated under reduced pressure and added with 1 N aqueous hydrochloric acid. The precipitated solid was collected by filtration and washed with ethyl acetate. To remove the remaining piperidine, this solid was suspended in 1 N aqueous hydrochloric acid, stirred, then collected by filtration and washed with ethyl acetate to obtain the title compound (2.00 g, 41%) as orange powder.

[2280] (A) (2-Dimethylaminoacetylamino)acetic acid tert-butyl ester

[2281] A solution of glycine tert-butyl ester hydrochloride (1.63 g) and sarcosine (1.00 g) in methylene chloride (20 ml) and N,N -dimethylformamide (20 ml) was added with triethylamine (2.03 ml), HOBr (1.44 g) and WSCD.HCl (2.04 g) with ice cooling and stirred at room temperature for 14 hours. The solvent was concentrated under reduced pressure, and the residue was diluted with ethyl acetate and washed with 10% aqueous citric acid, saturated aqueous sodium hydrogencarbonate and saturated brine. The organic layer was dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The residue was purified by silica gel column chromatography (chloroform \rightarrow chloroform:methanol=95:5) to obtain the title compound (2.08 g) as pale yellow oily substance.

[2378] (A) 4-Ethoxycarbonylmethylene-piperidine-1-tert-butyl ester

[2379] A solution of ethyl diethylphosphonoacetate (11.1 ml) in tetrahydrofuran (100 ml) was added with sodium hydride (95%, 1.32 g) at 0° C. and stirred at room temperature for 15 minutes. The reaction mixture was added with a solution of 4-oxo-piperidine-1-tert-butyl ester (10.0 g) in tetrahydrofuran (100 ml) at 0° C. and stirred at room temperature for 14 hours. The reaction mixture was diluted with water and extracted with ethyl acetate, and the organic layer was dried over anhydrous magnesium sulfate. The solvent was concentrated under reduced pressure, and the residue was purified by silica gel column chromatography (500 g, hexane:ethyl acetate=7:1) to obtain the title compound (12.2 g, 90%) as white solid.

[2381] (B) 4-Ethoxycarbonylmethylpiperidine-1-tert-butyl ester

[2382] A solution of 4-ethoxycarbonylmethylenepiperidine-1-tert-butyl ester (7.17 g) in ethanol (100 ml) was added with 5% Pd-C (wet, 1.5 g) and stirred at room temperature for 17 hours under hydrogen atmosphere. The catalyst was removed by filtration through a Celite layer and washed with ethanol, and the filtrate and the washing solution were combined and concentrated. The residue was removed by filtration through a silica gel pad and eluted with ethyl acetate. The solvent was concentrated under reduced pressure to obtain the title compound (7.31 g, quantitative) as colorless oily substance.

[2388] The following reaction was performed under argon atmosphere. A solution of 2-hydroxy-3-[(E)-2-[1-(4-methoxybenzyl)-1H-tetrazol-5-yl]vinyl]-4-oxo-4H-pyrido[1,2-a]pyrimidine-8-(4-tert-butylthiazol-2-yl)amide (500 mg) in N,N-dimethylformamide (4 ml) was added with diisopropylethylamine (624 μl) and diphenylphosphoryl chloride (371 μl) at 0° C. and stirred at 0° C. for 30 minutes. The reaction mixture was added with piperidin-4-yl-acetic acid ethyl ester hydrochloride (372 mg) and diisopropylethylamine (312 μl) at the same temperature and stirred at 80° C. for 1 hour. The reaction mixture was further added with piperidin-4-yl-acetic acid ethyl ester hydrochloride (372 mg) and diisopropylethylamine (312 μl) at the same temperature and stirred at 80° C. for 2 hours. The reaction mixture was returned to room temperature, diluted with water and extracted with ethyl acetate. The organic layer was dried over anhydrous magnesium sulfate, and the solvent was concentrated under reduced pressure. The residue was purified by silica gel column chromatography (50 g, chloroform:ethyl acetate=4:1) and silica gel column chromatography (40 g, hexane:ethyl acetate=2:1→3:2→1:1) to obtain the title compound (233 mg) as a hardly separable mixture.

acid tert-butyl ester

[2418] The following reaction was performed under argon atmosphere. A solution of (E)-3-[8-({[4-(tert-butyl)-1,3-thiazol-2-yl]amino}carbonyl)-2-hydroxy-4-oxo-4H-pyrido [1,2-a]pyrimidin-3-yl]-2-propenoic acid tert-butyl ester (500 mg) in N,N-dimethylformamide (4 ml) was added with diisopropylethylamine (740 μl) and diphenylphosphoryl chloride (441 μl) at 0° C. and stirred at 0° C. for 30 minutes. The reaction mixture was added with piperidin-4-yl-acetic acid ethyl ester hydrochloride (441 mg) and diisopropylethylamine (740 μl) at the same temperature and stirred at 80° C. for 1 hour. The reaction mixture was returned to room temperature, diluted with water and extracted with chloroform. The organic layer was dried over anhydrous magnesium sulfate, and the solvent was concentrated under reduced pressure. The residue was purified by silica gel column chromatography (35 g, chloroform \rightarrow chloroform:ethyl acetate=7:1, and 25g, hexane:ethyl acetate=3:1) to obtain the title compound (494 mg) as a hardly separable mixture.

Then the reaction mixture was added with 1 N aqueous sodium hydroxide (2.38 ml) four times with stirring at 50° C. over 5 hours. The reaction mixture was returned to room temperature, then added with 1 N hydrochloric acid and adjusted to about pH 4. The reaction mixture was diluted with saturated brine and extracted with chloroform. The organic layer was dried over anhydrous magnesium sulfate, and the solvent was concentrated under reduced pressure. The residue was purified by silica gel column chromatography (20 g, hexane:ethyl acetate=1:1 \rightarrow ethyl acetate) to obtain the title compound (241 mg, 38% for the two steps) as orange solid.

TEST EXAMPLE 1

Effect of Combined Use with Antimicrobial Agent on Multidrug Resistant *Pseudomonas aeruginosa*

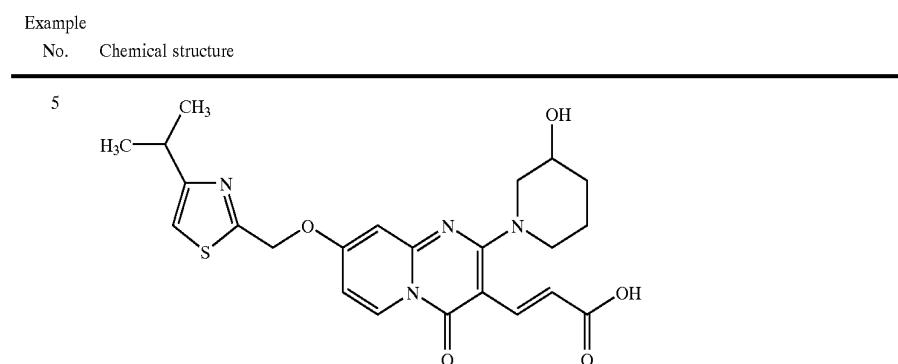

[2598] As multidrug resistant *Pseudomonas aeruginosa*, *Pseudomonas aeruginosa* PAM 1723 strain highly expressing the drug efflux pump was used. As antimicrobial drugs

for the combinational uses, levofloxacin (LVFX) as a quinolone antibacterial agent and aztreonam (AZT) as a monobactam antibiotic were used. Each of the compounds shown in Table 1 with Example No., which falls within the compounds of the present invention, was subjected to the measurement of its minimum concentration (μg/ml) that was required to enhance the antibacterial activity of levofloxacin when the test compound was used in combination with levofloxacin applied at a concentration of ¼, or ½ or less of the minimum inhibitory concentration against the PAM 1723 strain. As for aztreonam, a minimum concentration (μg/ml) of each test compound was measured that was required to enhance its antibacterial activity when the test compound was used in combination with aztreonam at a concentration of ½ or less of the MIC. Effects as combinational uses for 18 hours was indicated for each of the drugs. Effects were determined by visually observing the turbidity of the medium. The Müller-Hinton broth (MHB, Difco) was used as a medium, and the inoculum of the bacteria was 1×10⁶ CFU/ml. As clearly shown in Table 1, the compounds of the present invention exhibited effect on the drug resistant *Pseudomonas aeruginosa* in the combinational uses mainly by inhibiting resistance due to the drug efflux pump, and accordingly, it can be concluded that the class of compounds are expected to be useful clinically.

TEST EXAMPLE 2

Synergistic Effect of Combined Use of a Drug Efflux Pump Inhibitor and Plural Antibacterial Agents

[2600] By using a drug efflux pump inhibitor in combination with two or more types of antibacterial agents that can be substrates for the drug efflux pump, strong synergistic effect can be obtained and thus an effective therapeutic method can be provided for treatment of infectious diseases caused by *Pseudomonas aeruginosa*. Antibacterial agents for combination include antibacterial agents excreted by Mex type drug efflux pump of *Pseudomonas aeruginosa*, such as quinolones, β -lactams, tetracyclines, macrolides, chloramphenicol, sulfonamides, trimethoprim, β -lactamase inhibitors and so forth.

[2601] (1) Effect of Combined Use of a Pump Inhibitor, Levofloxacin (LVFX), and Meropenem (MEPM) Evaluated by the Three-dimensional Checker Board Method

[2602] The combination effect was measured by the three-dimensional checker board method by using wild type strain of *Pseudomonas aeruginosa* PAM1020. The test strain was inoculated into Mueller-Hinton broth containing various combinations of LVFX (from 0.25 to 0.004 μ g/ml with 2 fold dilutions, and 0 μ g/ml), MEPM (from 0.5 to 0.008 μ g/ml with 2 fold dilutions, and 0 μ g/ml), and the compound of Example 26 (from 40 to 0.625 μ g/ml with 2 fold dilutions, and 0 μ g/ml) at the inoculum size of 10^6 CFU/ml and

incubated for 18 hours at 37° C. MICs of LVFX and MEPM were measured in each combination according to checkerboard method, then FIC index was calculated with the following equation.

$$\text{FIC index} = a_0 + b/b_0$$

[2603] Wherein a0: MIC for Agent A (LVFX) used alone, a: MIC for Agent A when Agent A and B were used in combination, b0: MIC for Agent B (MEPM) used alone, b: MIC for Agent B when Agent A and Agent B were used in combination.

[2604] It was determined that there was synergistic effect when FIC index was 0.5 or less, additive effect of weak synergistic effect when the index more than 0.5 but not more than 0.75, no effect of combined use when the index was more than 0.75 but not more than 2, and antagonistic effect when the index was more than 2.0.

[2605] The results are shown in the following table. The table shows minimum FIC index determined by usual checker board method. Synergistic effects of the compound of Example 26 were clearly observed in every concentration tested (from 40 to 0.625 μ g/ml with 2 fold dilutions). Further, the effects were observed dose-dependently. The MICs of each compounds for *Pseudomonas aeruginosa* PAM1020 were, 0.25 μ g/ml for LVFX, 0.5 μ g/ml for MEPM, and >128 μ g/ml for the compound of Example 26.

	Concentration of the compound of Example 26 ($\mu\text{g}/\text{ml}$)							
	0	0.625	1.25	2.5	5	10	20	40
minimum FIC index for LVFX and MEPM combination	1.000	0.531	0.500	0.375	0.313	0.266	0.250	0.250

TEST EXAMPLE 3

Effect of Combined Use of Drug Efflux Pump Inhibitor and Disinfectant

[2606] By using a drug efflux pump inhibitor in combination with a disinfectant that can be a substrate of the drug efflux pump, effect of combined use can be achieved and an effective disinfection method can be provided.

[2607] Effects of a combined use of a drug efflux pump inhibitor and alkyldiaminoethylglycine hydrochloride (AEG, trade name: Tego 51) or chlorhexidine gluconate (CHG, trade name: Hibiten) on *Pseudomonas aeruginosa* PAM 1723 (a strain highly expressing MexAB-OprM drug efflux pump) was determined by the broth dilution method. The compound of Example 26 was added at a final concentration of 10 $\mu\text{g}/\text{ml}$ to Mueller-Hinton broth (MHB) containing a disinfectant at a concentration after 2-fold serial dilution. The amount of the test bacteria inoculated was 1×10^6 CFU/ml, and after standing cultivation at 37° C. for 18 hours, the culture was observed by visual inspection. The minimum concentration that gave no turbidity as in the control of MHB was determined as MIC.

[2608] The results are shown in the following table. Evaluation of the effect of the combined use of the disinfectant and the compound of Example 26 revealed that the activities of AEG and CHG on PAM 1723 were enhanced by two times and four times, respectively, by the combined use with 10 $\mu\text{g}/\text{ml}$ of the compound of Example 26.

Example 281

[2609] The following three clinically isolated *Pseudomonas aeruginosa* strains: (1) DNS 5494 strain (MexAB-OprM pump highly expressed strain), (2) DNS 5626 strain (MexAB-OprM pump highly expressed and MexXY pump highly expressed strain) and (3) DNS 5512 strain (MexAB-OprM pump low expressed and MexXY pump highly

expressed strain), which were collected in 1998, were used as test strains to perform the following test. A cell suspension of each test strain adjusted to about 10^7 CFU/mL in 33 mM phosphate buffer (pH 7.0) was spread with a swab for antimicrobial susceptibility test. The swab was pressed on a wall of test tube to remove excess cell suspension, and then the cell suspension was uniformly spread on an antibiotic susceptibility test agar medium (Mueller-Hinton agar medium). Aztreonam was used as a β -lactam antibiotic and Levofloxacin as a quinolone antibiotic, and 25 μL of a solution of each antibacterial agent was impregnated into an antibiotic susceptibility test disk so that the content was 30 μg for Aztreonam and 5 μg for Levofloxacin. Further, Compound A as an MexAB-OprM pump inhibitor was dissolved in 5% (v/v) of DMSO (dimethyl sulfoxide), and 64 μL (50 μg of Compound A) of the solution was impregnated into a thick disk. Furthermore, a disk impregnated with 64 μL of a 5% (v/v) of DMSO solution instead of the solution of Compound A was also prepared as a negative control.

[2610] On the agar medium, the MexAB-OprM pump inhibitor containing disk was placed at the center, and the Aztreonam containing disk and the MexAB-OprM pump inhibitor containing disk were placed with a space of 2.0 cm. The Levofloxacin containing disk was placed on the 180 degrees opposite side of the Aztreonam disk with a space of 2.0 cm relative to the MexAB-OprM pump inhibitor containing disk as a center. The agar medium was incubated at 37° C. for 18 hours, and shape and size of the growth inhibition zones formed around the disks containing the antibacterial agents were investigated and compared with those of the negative control. The results are shown in FIG. 1 (in the figure, “with efflux pump inhibitor” represents the result obtained by using Compound A as a drug efflux pump inhibitor in combination).

[2611] When the test strain expressed the MexAB-OprM pump (DNS 5494 strain, MexAB-OprM pump highly expressed strain), inhibition zones were observed around the β -lactam antibiotic containing disk and around the quinolone antibiotic containing disk each of which was placed at a position that gave overlap of the diffusion area with that of the MexAB-OprM pump inhibitor (DNS 5494 strain, right column). Furthermore, under excess expression of the MexAB-OprM pump, a further expansion of the inhibition zone was observed. On the other hand, it was found that only small concentric inhibition zones were formed (DNS 5494 strain, left column) around the β -lactam antibiotic containing disk and around the quinolone antibiotic containing disk each of which was placed at a position that gave no overlap of the diffusion area of the β -lactam antibiotic or the quinolone antibacterial agent with that of the MexAB-OprM pump inhibitor. Based on comparison of the sizes and shapes of these inhibition zones, it was concluded that the strain tested expressed the MexAB-OprM pump, and at the same time, a relative expression amount was also clearly recognized.

[2612] Further, when the strain expressed the MexAB-OprM pump and simultaneously expressed another drug efflux pump (DNS 5626 strain, MexAB-OprM pump highly expressed and MexXY pump highly expressed strain), an inhibition zone was observed around the β -lactam antibiotic containing disk in a region where the diffusion area of the antibiotic overlapped that of the MexAB-OprM pump inhibitor (DNS 5626, right column), whereas no inhibition

zone or only a small inhibition zone was observed in a region where the diffusion area of the quinolone antibacterial agent overlapped that of the MexAB-OprM pump inhibitor (DNS 5626, right column). Furthermore, only small concentric inhibition zones (DNS 5626 strain, left column) were formed around the β -lactam antibiotic containing disk and around the quinolone containing disk each of which was placed at a position that gave no overlap of the diffusion areas of the β -lactam or the quinolone antibacterial agent with that of the MexAB-OprM pump inhibitor. Expansion of the inhibition zone around the β -lactam antibiotic containing disk was thus observed due to the diffusion of the MexAB-OprM pump inhibitor (where existence of the MexAB-OprM pump was verified) and no expansion of the inhibition zone by the quinolone antibacterial agent was observed. As a result, it was concluded that the test strain expressed a drug efflux pump other than the MexAB-OprM pump.

[2613] Further, when the strain had a low expression level of the MexAB-OprM pump and resistance to quinolone antibacterial agent relatively attributable to expression of another Mex pump (DNS 5512 strain, MexAB-OprM pump low expressed and MexXY pump highly expressed strain), an inhibition zone was formed around the β -lactam antibiotic containing disk placed at a position that gave overlap of the diffusion area of the antibiotic with that of the MexAB-OprM pump inhibitor. Whilst around the quinolone containing disk, almost no expansion of the inhibition zone due to the diffusion of the MexAB-OprM pump inhibitor was observed. Upon consideration of the pattern of antimicrobial susceptibility, it was concluded that, when the test strain was assumed to have low level of expression of the MexAB-OprM pump, a Mex pump other than the MexAB-OprM pump was expressed in a relatively higher level in the strain.

Example 282

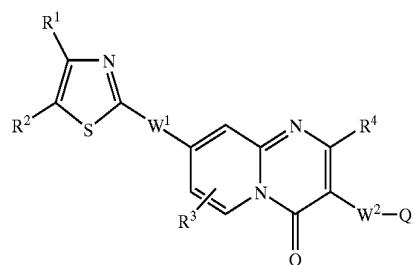

[2614] As strains to be tested and method for spreading the test strains on the agar medium, the same strains and method as those used in Example 281 were applied. A solution of Compound A at a concentration of 200 μ g/mL (5% (v/v) in DMSO) was prepared, and 400 μ L of the solution was added to the antibiotic susceptibility test agar medium (20 mL) and mixed sufficiently before gelation to prepare an agar medium containing a MexAB-OprM pump inhibitor (final concentration of Compound A: 4 μ g/mL), and then each test bacterium was spread on the agar. The same agar medium not containing Compound A was prepared as a negative control, and the test bacterial suspension was spread on the agar. Then, one strip of Etest Aztreonam AT (registered trademark, AB BIODISK, Sweden) was placed at the center of the agar medium containing Compound A. Further, one strip of Etest Levofloxacin LE (registered trademark, AB BIODISK, Sweden) was placed on the medium in parallel to the Etest Aztreonam AT with a space of 3.0 cm. In the same manner, the aforementioned two kinds of Etest were placed on the agar medium not containing Compound A as a negative control. After incubation at 37° C. for 18 hours, the minimum inhibitory concentration (MIC) was determined based on the inhibition zones formed around the Etest Aztreonam AT and Etest Levofloxacin LE on the agar medium containing Compound A and compared with MIC obtained in the negative control. The results are shown in FIG. 2. As shown in the figure, more accurate measurement

of activity of combinational application and estimation of expression amount of a pump was achieved by using Etest in compared to a disk.

[2615] Industrial Applicability

[2616] The medicament of the present invention has an inhibitory activity against the drug efflux pumps of microorganisms, and the medicament has preventing action on the acquisition of resistance to an antimicrobial drug by a microorganism, as well as resistant-eliminating action on a microorganism with acquired resistance. Therefore, the medicament of the present invention can achieve excellent effect in preventive and/or therapeutic treatment of a microbial infection when used, for example, in combination with the administration of an antimicrobial drug.

1. A medicament for preventive and/or therapeutic treatment of a microbial infection, which comprises as an active ingredient a compound represented by the following general formula (I) or a physiologically acceptable salt thereof, or a hydrate thereof:

wherein,

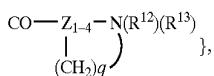

R¹ and R² each independently represent hydrogen atom, a halogen atom, hydroxyl group, a group of OZ₁₋₆ (the group of OZ₁₋₆ represents an alkyl group having 1-6 carbon atoms or a fluoroalkyl group having 1-6 carbon atoms, which bonds via the oxygen atom), a group of S(O)_nZ₁₋₄ (Z₁₋₄ represents an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms or an alkyne group derived therefrom), a group of N(R¹²)(R¹³) (R¹² and R¹³ each independently represent hydrogen atom, an alkyl group having 1-4 carbon atoms or a fluoroalkyl group having 1-4 carbon atoms), a group of Z₁₋₈ which may be substituted (Z₁₋₈ represents an alkyl group having 1-8 carbon atoms or a fluoroalkyl group having 1-8 carbon atoms), a 5- to 7-membered cyclic alkyl group, an aryl group, a heteroaryl group, or a 4- to 7-membered saturated or partially saturated heterocyclic group (the cyclic alkyl group, aryl group, heteroaryl group and heterocyclic group may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OZ₁₋₄, a group of S(O)_nZ₁₋₄, a group of N(R¹²)(R¹³), a group of Z₁₋₄, carboxyl group, a group of CO₂Z₁₋₄, group of CONH₂, a group of CONH(Z₁₋₄) and a group of CON(Z₁₋₄)(Z₁₋₄));

R^3 represents hydrogen atom, a halogen atom, hydroxyl group or an amino group;

R^4 represents a group selected from the group consisting of hydrogen atom, a group of $-OZ_{0-4}R^5$ (Z_{0-4} represents an alkylene group having 1-4 carbon atoms, a fluorine-substituted alkylene group having 1-4 carbon atoms or a single bond, and

R^5 represents a 5- to 7-membered cyclic alkyl group, an aryl group, a heteroaryl group or a 4- to 7-membered saturated or partially saturated heterocyclic group (the cyclic alkyl group, aryl group, heteroaryl group and heterocyclic group may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of OZ_{1-4} , a group of $S(O)_nZ_{1-4}$, a group of $N(R^{12})(R^{13})$, a group of Z_{1-4} , carboxyl group, a group of CO_2Z_{1-4} , group of $CONH_2$, a group of $CONH(Z_{1-4})$ and a group of $CON(Z_{1-4})(Z_{1-4})$), a group of $-S(O)_nZ_{0-4}R^5$, a group of $-N(R^6)(R^7)$ { R^6 and R^7 each independently represent hydrogen atom or Z_{1-4} , or they may bind to each other to form a saturated or unsaturated 5- to 7-membered ring (the ring may contain one or two hetero atoms as ring constituting atoms), and R^6 and R^7 may have one to three substituents selected from the group consisting of a halogen atom, hydroxyl group, a group of $OCON(R^{15})(R^{16})$, a group of $CON(R^{15})(R^{16})$, a group of $N(R^{12})CON(R^{15})(R^{16})$, a group of Z_{1-4} , a group of OZ_{1-4} , a group $S(O)_nZ_{1-4}$, group of CH_2OH , a group of $(CH_2)_mN(R^{12})(R^{13})$, a group of $Z_{1-4}CON(R^{15})(R^{16})$, a group of $SO_2N(R^{12})(R^{13})$, a group of $OSO_2N(R^{12})(R^{13})$, a group of OSO_2R^{12} , a group of $NCOZ^{14}R^{15}$ (in the formula, R^{15} and R^{16} independently represent hydrogen atom, a group of $Z_{1-6}R^{11}$, a group of $Z_{1-4}N(R^{12})(R^{13})$, a group of $Z_{1-4}OH$, and a group of $Z_{1-4}OZ_{1-4}$), carboxyl group, cyano group, a group of $COZ_{1-4}R^{10}$, a group of $CO-Z_{1-4}(R^{10})-N(R^{12})(R^{13})$ (R is a substituent corresponding to a side chain on an amino acid carbon or a group of $-Z_{1-4}-R^{11}$ (R^{11} represents a substituent which forms a quaternary salt)) and a group of

a 5- or 6-membered aryl group which may be substituted and a 5- or 6-membered unsaturated heterocyclic group which may be substituted;

W^2 represents a single bond or $-C(R^8)=C(R^9)-(R^8$ and R^9 each independently represent hydrogen atom, a halogen atom, a lower alkyl group, an alkoxy group, cyano group, carboxyl group, hydroxymethyl group, cyanomethyl group, vinyl group or a group of $N(R^{12})(R^{13})$), Q represents an acidic group, and W^2 and Q may bind together to form vinylidenethiazolidinedione in E- or Z-configuration or an equivalent heterocyclic ring;

m and n each independently represent an integer of 0 to 2, and q represents an integer of 0 to 3.

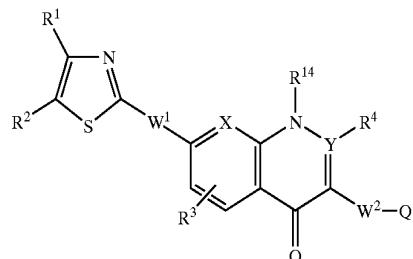

2. A medicament for eliminating resistance of a microorganism with acquired drug resistance, which comprises the

compound represented by the aforementioned general formula (I) according to claim 1 or a physiologically acceptable salt thereof as an active ingredient.

3. A medicament for enhancing effect of an antimicrobial agent, which comprises a compound represented by the aforementioned general formula (I) according to claim 1 or a physiologically acceptable salt thereof as an active ingredient.

4. A pharmaceutical composition for preventive and/or therapeutic treatment of a microbial infection, which comprises a compound represented by the aforementioned general formula (I) according to claim 1 or a physiologically acceptable salt thereof together with an antimicrobial agent.

5. A medicament for preventive and/or therapeutic treatment of a microbial infection, which comprises as an active ingredient a compound represented by the following general formula (I) or a physiologically acceptable salt thereof, or hydrates thereof

wherein, R^1 , R^2 , R^3 , R^4 , W^1 , W^2 and Q have the same meanings as those defined above; R^{14} represents hydrogen atom, Z_{1-4} , $Z_{1-4}R^5$ or $Z_{1-4}OR^5$; and X and Y each independently represent C—H or nitrogen atom.

6. A method for judging effectiveness of a drug efflux pump inhibitor against a microorganism, which comprises the steps of:

(A1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent as a spot on the surface of the agar medium and culturing the microorganism;

(A2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during the culture period;

(A3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist; and

(A4) judging that the drug efflux pump inhibitor is effective against the microorganism when the growth degree of the microorganism determined in the step (A2) is significantly higher than the growth degree of the microorganism determined in the step (A3).

7. The method according to claim 6, wherein the antibacterial agent is provided as a spot on the agar medium surface by means of a disk.

8. The method according to claim 6, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface.

9. The method according to claim 6, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium.

10. The method according to claim 6, wherein the microorganism is *Pseudomonas aeruginosa*.

11. A method for identifying a drug efflux pump expressed in a microorganism, which comprises the steps of:

(B1) spreading a microorganism to be tested on a surface of an agar medium, then providing an antibacterial agent that can be excreted by a particular drug efflux pump as a spot on the surface of the agar medium and culturing the microorganism;

(B2) determining a growth degree of the microorganism in a region of the agar medium into which the antibacterial agent has diffused during culture period;

(B3) determining a growth degree of the microorganism in a region of the agar medium in which the antibacterial agent that has diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that said drug efflux pump inhibitor is a specific inhibitor for the particular drug efflux pump); and

(B4) judging that the microorganism expresses the drug efflux pump of the particular type when the growth degree of the microorganism measured in the step (B2) is significantly higher than the growth degree of the microorganism determined in the step (B3).

12. The method according to claim 11, wherein the antibacterial agent is provided as a spot on the agar medium surface by using a disk.

13. The method according to claim 11, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface.

14. The method according to claim 11, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium.

15. The method according to claim 11, wherein the microorganism is *Pseudomonas aeruginosa*.

16. The method according to claim 11, wherein the particular drug efflux pump is a MexAB-OprM pump.

17. The method according to claim 11, wherein the antibacterial agent is a β -lactam antibiotic.

18. The method according to claim 17, wherein the antibacterial agent is Aztreonam.

19. A method for verifying expression of two or more kinds of drug efflux pumps in a microorganism, which comprises the steps of:

(C1) spreading a microorganism to be tested on a surface of an agar medium, then providing two or more kinds of antibacterial agents (provided that each of the two or more kinds of the antibacterial agents has different effluxing specificity by the two or more kinds of drug efflux pumps, and one of the two or more kinds of the

antibacterial agents (hereinafter referred to as "Antibacterial agent (1)") has a property of being excreted by only one of the two or more kinds of the drug efflux pumps (hereinafter referred to as "Drug efflux pump (1)", whilst the other antibacterial agent or agents have a property of being excreted by Drug efflux pump (1) and the other drug efflux pump or pumps);

(C2) determining a growth degree of the microorganism in a region of the agar medium into which each antibacterial agent has solely diffused during culture period;

(C3) determining a growth degree of the microorganism in a region of the agar medium in which each antibacterial agent that has solely diffused during the culture period and a drug efflux pump inhibitor contained in the agar medium coexist (provided that the drug efflux pump inhibitor is a specific inhibitor for Drug efflux pump (1)); and

(C4) judging that the microorganism expresses Drug efflux pump (1) and one or more kinds of other drug efflux pumps when the growth degree of the microorganism determined in the step (C2) is significantly higher than the growth degree of the microorganism determined in the step (C3) for Antibacterial agent (1) and the growth degree of the microorganism determined in the step (C2) is significantly lower than the growth degree of the microorganism determined in the step (C3) for the other antibacterial agent or agents.

20. The method according to claim 19, wherein each of the antibacterial agents is provided as a spot on the agar medium surface each by using a disk.

21. The method according to claim 19, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor diffused from a disk provided as a spot on the agar medium surface.

22. The method according to claim 19, wherein the drug efflux pump inhibitor contained in the agar medium is the drug efflux pump inhibitor added beforehand to the agar medium during preparation of the agar medium.

23. The method according to claim 19, wherein the microorganism is *Pseudomonas aeruginosa*.

24. The method according to claim 19, wherein one of the two or more kinds of drug efflux pumps is a MexAB-OprM pump.

25. The method according to claim 19, wherein the two or more kinds of antibacterial agents include a combination of a β -lactam antibiotic and a quinolone antibacterial agent.

26. The method according to claim 25, the antibacterial agents are Aztreonam and Levofloxacin.

27. The method according to claim 19, wherein the drug efflux pump inhibitor is a specific inhibitor for a MexAB-OprM pump.

28. The method according to claim 19, wherein the drug efflux pump inhibitor is a compound represented by the following formula.
