FUSED HETEROCYCLIC DERIVATIVE AND USE THEREOF**TECHNICAL FIELD**

[0001] The present invention relates to a fused heterocyclic derivative and use thereof. More particularly, the present invention relates to a compound having a strong Smo inhibitory activity and useful for the prophylaxis or treatment of cancer and the like, and use thereof.

BACKGROUND OF THE INVENTION

[0002] The study of morphogenesis during the developmental stage has been conducted based on the screening of variant using *Drosophila*. Hedgehog gene (*hh*) was found as one of the genes that cause morphological abnormality of *Drosophila* embryo due to mutation thereof. Hedgehog gene product (*Hh*) is a secretory protein, which is produced as an about 45 kDa precursor and then divided, due to autolysis, into a 20 kDa N-terminal side domain, which is a main active principle, and a 25 kDa C-terminal side domain. The 20 kDa N-terminal side domain, which is a main active principle, is modified by fatty acid on the N-terminal and cholesterol on the C-terminal thereof. The Hedgehog signal transduction system is formed by the protein group described below. *Hh* receptor is Patched (*Ptch*), which is a twelve-transmembrane-type protein. *Ptch* acts on Smoothened (*Smo*), which is a seven-transmembrane-type protein, and suppresses the function of *Smo* in the absence of *Hh*. When *Hh* is bound to the receptor *Ptch*, suppression of *Smo* is released and *Smo* is activated. The signal produced by the activation of *Smo* activates transcription factor *Ci*, which regulates the expression of the gene group involved in the morphogenesis (non-patent document 1).

[0003] A pathway corresponding to the *Drosophila* Hedgehog signal transduction system has been confirmed also in mammals. In human, for example, three types of gene products, sonic hedgehog (*Shh*), indian hedgehog (*Ihh*) and desearth hedgehog (*Dhh*), are known to correspond to *Drosophila Hh*, and undergo post-translational modification as in *Drosophila Hh* (non-patent document 2). In human *Shh*, a 19 kDa active principle is cleaved out from a 45 kDa precursor protein by autolysis, and fatty acid and cholesterol are added to the N-terminal and C-terminal thereof, respectively (non-patent document 3). Such modification is considered to be essential for the maintenance of *Shh* activity and, for example, 40 times enhanced activity was achieved by the addition of palmitic acid to *Escherichia coli* recombinant human *Shh* free of N-terminal modification with fatty acid, and 160 times enhanced activity was achieved by the addition of myristic acid thereto (non-patent document 4). On the other hand, as a human gene corresponding to *Drosophila Smo*, human *Smo* is known, and as a human gene corresponding to *Drosophila Ptch*, 2 types of *Ptch1* and *Ptch2* are known. In addition, a transcription factor corresponding to *Drosophila Ci* is considered to be *Gli* in human, and 3 types of *Gli1*, *Gli2* and *Gli3* are known (non-patent document 5). *Shh/Ihh/Dhh* are each bound to *Ptch1* and activate *Smo* by inhibiting the bond between *Ptch1* and *Smo*. *Shh/Ihh/Dhh* are also bound to *Ptch2*, *Hip1*, *Gas1* and *Cdo/Boc*, besides *Ptch1*, and regulate the activation of *Smo*. A signal transduction from *Smo* induces nuclear localization of *Gli1* and *Gli2*, and activate transcription of *Gli1* (non-patent document 6).

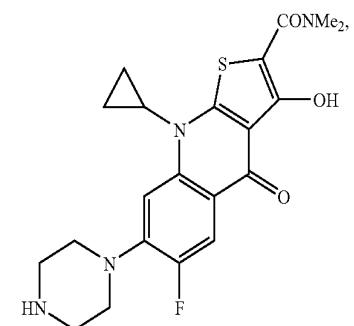

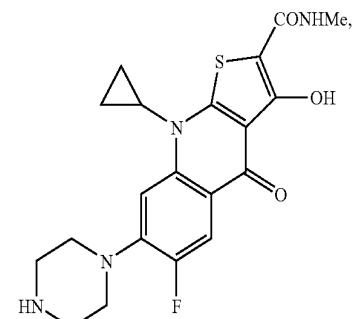

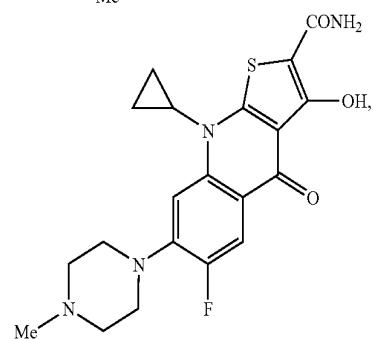

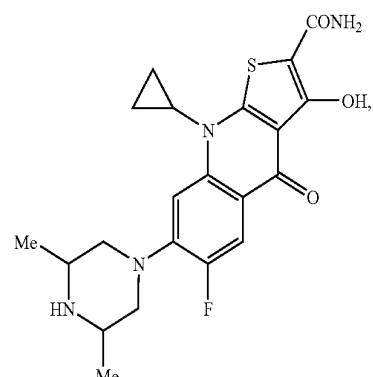

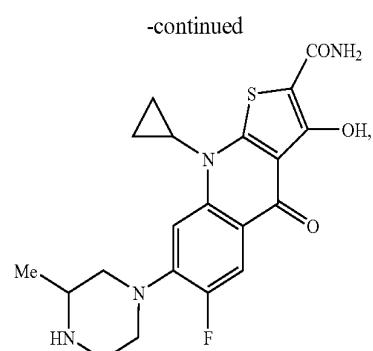

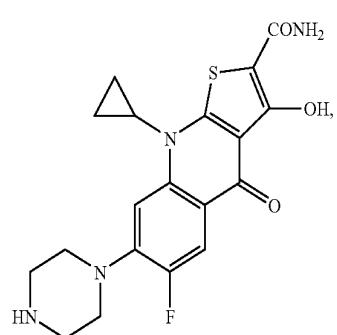

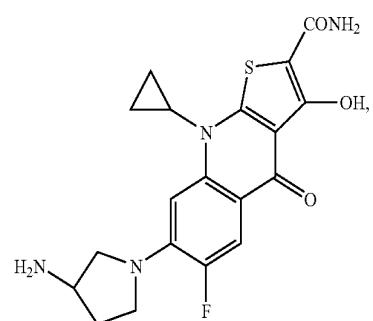

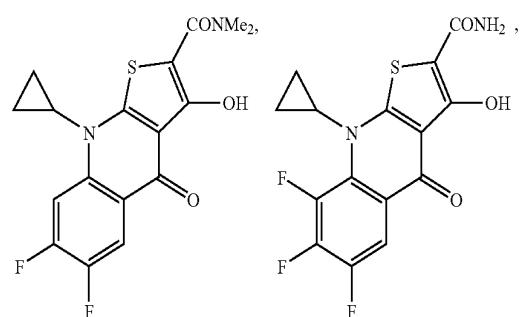

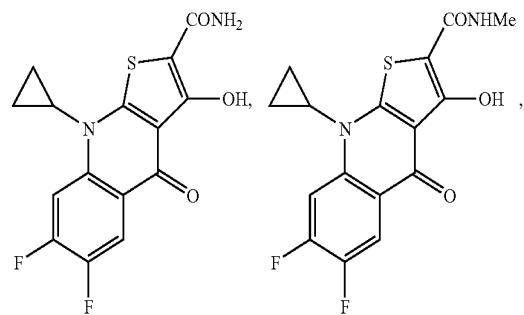

[0004] The Hedgehog signal is involved in the morphogenesis in the developmental stages also in mammals. In human, for example, patients with Holoprosencephaly, which is a congenital developmental abnormality, showed mutation in *Shh* (non-patent document 7). Moreover, a natural compound Cyclopamine derived from white hellebore known as a compound inducing Cyclopus in sheep (non-patent document 8) was confirmed to inhibit *Smo* as action mechanism thereof (non-patent document 9). Furthermore, an *Shh* knockout mouse was prepared, and its phenotype was found to include Cyclopus, malformation of extremities (non-patent document 10), and neural plate malformation (non-patent document 11).

[0005] Hedgehog signal is inherently a developmental signal, which is promoted in tumor tissues and functions as a cancer cell growth and survival signal. Hedgehog signal is considered to function for the growth and survival of cancer cells in an autocrine mode, or function between cancer cells and cancer interstitial cells in a paracrine mode, in tumor tissues (non-patent document 12). In an autocrine mode, it works for the growth and maintenance of cancer cells, via transcription activation by *Gli-1*, by abnormal cell cycle control due to increased expression of Cyclin D and decreased expression of p21, promotion of proliferation signal by activation of EGFR pathway and the like. On the other hand, in a paracrine mode, since *Shh* expressed in cancer cells acts on *Smo* in cancer interstitial cells, growth factors such as insulin-like growth factor-1, fibroblast growth factor, platelet-derived growth factor and the like are transmitted from cancer interstitial cells to cancer cells, and function for the growth and survival of cancer cells. It is also considered that promotion of VEGF, PDGF pathway and the like by *Gli-1* promotes tumor angiogenesis (non-patent document 13). As to the mechanism of promotion of Hedgehog signal, a cancer in which Hedgehog signal is promoted due to mutation of *Ptch1* and a cancer which is promoted by overexpression of *Shh*, which is one of the ligands, have been reported (non-patent document 14). As a cancer in which Hedgehog signal is promoted due to mutation, basal cell cancer and medulloblastoma are known, and mutation of *Ptch1* observed in these cancers activates Hedgehog signal in a ligand independent manner (non-patent document 15). As a cancer in which Hedgehog signal is promoted by overexpression of *Shh*, pancreatic cancer (non-patent document 16) and the like have been reported. In a transgenic mouse in which *Shh* is forcedly expressed in the pancreas, Hedgehog signal is suggested to be involved not only in the growth and maintenance of cancer, but also carcinogenic process, since a PanIN-like lesion in the initial stages of cancer progress was found in the pancreas (non-patent document 17). Furthermore, Hedgehog signal is considered to function for the growth and survival of cancer stem cells, and play a key role in the metastasis or postoperative recurrence of tumor and the like (non-patent document 18).

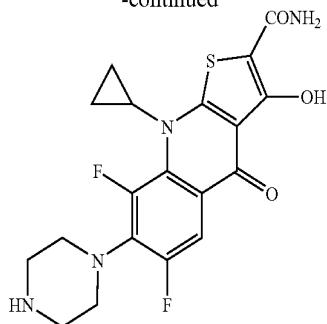

[0006] As the Hedgehog signal inhibitor, the following are known. Cyclopamine, which is a naturally occurring *Smo* inhibitory compound, has been reported to show a tumor growth suppressive effect on glioma (non-patent document 19) and the like. As a synthetic low-molecular-weight compound inhibiting *Smo*, CUR-61414 (non-patent document 20) and SANT-1, 2, 3, 4 (non-patent document 21) have been reported. It has been reported with regard to the Hedgehog signal inhibitory antibody that administration of an anti-*Shh*

antibody to a cancer-bearing nude mouse transplanted with colorectal cancer cell line HT-29 resulted in cancer regression (patent document 1).

[0760] A prodrug of compound (I) may also be a compound converted into compound (I) under physiological conditions, such as those described in IYAKUHIN no KAIHATSU (Development of Pharmaceuticals), Vol. 7, Design of Molecules, p. 163-198, Published by HIROKAWA SHOTEN (1990).

[0761] When compound (I) has an isomer such as optical isomer, stereoisomer, positional isomer, rotational isomer and the like, any isomer and a mixture thereof are encompassed in compound (I). For example, when compound (I) has an optical isomer, an optical isomer resolved from a racemate is also encompassed in compound (I). Such isomers can be obtained as independent products by a synthesis means or a separation means (concentration, solvent extraction, column chromatography, recrystallization and the like) known per se.

[0763] Compound (I) may also be a cocrystal.

[0764] Compound (I) may be a hydrate, a non-hydrate, a solvate or a non-solvate, both of which are encompassed in compound (I) and the like.

[0765] A compound labeled with an isotope (e.g., ²H, ³H, ¹⁴C, ³⁵S, ¹²⁵I etc.) is also encompassed in compound (I).

[0766] Compound (I) of the present invention, or a salt thereof, or a prodrug thereof (sometimes to be abbreviated as “the compound of the present invention” in the present specification) interacts, for example, with human Smo protein and changes the steric structure thereof, whereby formation of a complex with a protein involved in the signal transduction in the cytoplasm is inhibited and the Hedgehog signal transduction system is inhibited. Alternatively, the compound of the present invention interacts with human Smo protein and directly inhibits formation of a complex of human Smo protein with a protein involved in the Hedgehog signal transduction system in the cytoplasm, whereby the Hedgehog signal transduction system is inhibited. Alternatively, the compound of the present invention interacts with a site of an Smo protein, for example, phosphorylation site and the like, which is modified by a protein involved in the Hedgehog signal transduction system, whereby modification such as phosphorylation of Smo and the like is inhibited and the Hedgehog signal transduction system is inhibited.

[0767] Inhibition of the Hedgehog signal transduction system can be measured, for example, by quantifying a decrease in the expression level of a reporter gene connected to the downstream of the Gli binding site based on the fluorescence intensity according to Experimental Example 1. Alternatively, it can be measured by quantifying the expression of Gli-1 mRNA in a cell extract by quantitative PCR method and the like. A compound that inhibits Hedgehog signal targets Smo, which can be confirmed, for example, by binding fluorescence-labeled Cyclopamine and a test compound to cells expressing Smo, measuring the fluorescence level of the cell, and comparing the value with that without addition of a test compound to find a decrease.

[0768] Accordingly, the compound of the present invention is useful as an Smo inhibitor for mammals (e.g., mouse, rat, hamster, rabbit, cat, dog, bovine, sheep, monkey, human, etc.). The compound of the present invention is used as a pharmaceutical agent such as an agent for the prophylaxis or treatment of diseases possibly influenced by Smo, for

[1] Injection and Preparation Thereof.

[0818] An injection prepared by dissolving the compound of the present invention or the concomitant drug into water is preferable. This injection may be allowed to contain a benzoate and/or salicylate.

[0819] The injection is obtained by dissolving the compound of the present invention or the concomitant drug, and if desirable, a benzoate and/or salicylate, into water.

[0821] The concentration of the compound of the present invention or the concomitant drug in an injection is from 0.5 to 50 w/v %, preferably from about 3 to 20 w/v %. The concentration of a benzoate or/and salicylate is from 0.5 to 50 w/v %, preferably from about 3 to 20 w/v %.

[0822] The injection of the present invention appropriately contains additives usually used in an injection, for example, a stabilizer (e.g., ascorbic acid, sodium pyrosulfite and the like), a surfactant (e.g., Polysorbate 80, macrogol and the like), a solubilizer (e.g., glycerin, ethanol and the like), a buffer (e.g., phosphoric acid and alkali metal salt thereof, citric acid and alkali metal salt thereof, and the like), an isotonizing agent (e.g., sodium chloride, potassium chloride and the like), a dispersing agent (e.g., hydroxypropylmethylcellulose, dextrin), a pH regulator (e.g., hydrochloric acid, sodium hydroxide and the like), a preservative (e.g., ethyl parahydroxybenzoate, benzoic acid and the like), a dissolving agent (e.g., conc. glycerin, meglumine and the like), a solubilizing agent (e.g., propylene glycol, sucrose and the like), a soothing agent (e.g., glucose, benzyl alcohol and the like), and the like. These additives are generally blended in a proportion usually used in an injection.

[0823] It is advantageous that pH of an injection be controlled from pH 2 to 12, preferably from pH 2.5 to 8.0, by addition of a pH regulator.

[0824] An injection is obtained by dissolving the compound of the present invention or the concomitant drug and if desirable, a benzoate and/or a salicylate, and if necessary, the above-mentioned additives into water. [0826] It may be advantageous that an aqueous solution for injection is subjected to high pressure heat sterilization at 100 to 121° C. for 5 to 30 min.

[0827] Further, a preparation endowed with an antibacterial property of a solution may also be produced so that it can be used as a preparation which is divided and administered multiple-times.

[2] Sustained Release Preparation or Immediate-Release Preparation, and Preparation Thereof

[0828] A sustained release preparation is preferable which is obtained, if desirable, by coating a nucleus containing the compound of the present invention or the concomitant drug with a film agent such as a water-insoluble substance, swellable polymer and the like. For example, a sustained release preparation for oral administration of once administration per day type is preferable.

[0829] As the water-insoluble substance used in a film agent, there are listed, for example, cellulose ethers such as ethylcellulose, butylcellulose and the like, cellulose esters such as cellulose acetate, cellulose propionate and the like, polyvinyl esters such as polyvinyl acetate, polyvinyl butyrate and the like, acrylic acid/methacrylic acid copolymers, methyl methacrylate copolymers, ethoxyethyl methacrylate/cinnamoethyl methacrylate/aminoalkyl methacrylate copolymers, polyacrylic acid, polymethacrylic acid, methacrylic acid alkylamide copolymers, poly(methyl methacrylate), polymethacrylate, polymethacrylamide, aminoalkyl methacrylate copolymers, poly(methacrylic anhydride), glycidyl methacrylate copolymer, particularly, acrylic acid-based polymers such as Eudragit (manufactured by Rohm Pharma) such as Eudragit RS-100, RL-100, RS-30D, RL-30D, RL-PO, RS-PO (ethyl acrylate/methyl methacrylate/trimethylchloride methacrylate/ethyl ammonium copolymer), Eudragit NE-30D (methyl methacrylate/ethyl acrylate copolymer), and the like, hydrogenated oils such as hydrogenated castor oil (e.g., Lubri wax (manufactured by Freund Corporation) and the like), waxes such as carnauba wax, fatty acid glycerin ester, paraffin and the like, polyglycerin fatty acid esters, and the like.

[0830] As the swellable polymer, polymers having an acidic dissociating group and showing pH dependent swell are preferable, and polymers having an acidic dissociating group, which manifest small swelling in acidic regions such as in stomach and large swelling in neutral regions such as in small intestine and large intestine, are preferable.

[0831] As such a polymer having an acidic dissociating group and showing pH dependent swell, cross-linkable polyacrylic acid polymers such as, for example, Carbomer 934P, 940, 941, 974P, 980, 1342 and the like, polycarbophil, calcium polycarbophil (all of which are manufactured by BF Goodrich), Hiviswako 103, 104, 105, 304 (all are manufactured by Wako Pure Chemical Industries, Ltd.), and the like, are listed.

[0832] The film agent used in a sustained release preparation may further contain a hydrophilic substance.

[0833] As the hydrophilic substance, for example, polysaccharides which may contain a sulfate group such as pullulan, dextrin, alkali metal alginate and the like, polysaccharides having a hydroxyalkyl or carboxyalkyl such as hydroxypropylcellulose, hydroxypropylmethylcellulose, carboxymethylcellulose sodium and the like, methylcellulose, polyvinylpyrrolidone, polyvinyl alcohol, polyethylene glycol and the like can be mentioned.

[0834] The content of a water-insoluble substance in the film agent of a sustained release preparation is from about 30 to about 90% (w/w), preferably from about 35 to about 80% (w/w), further preferably from about 40 to about 75% (w/w), the content of a swellable polymer is from about 3 to about 30% (w/w), preferably from about 3 to about 15% (w/w). The film agent may further contain a hydrophilic substance, and in which case, the content of a hydrophilic substance in the film agent is about 50% (w/w) or less, preferably about 5 to about 40% (w/w), further preferably from about 5 to about 35% (w/w). This % (w/w) indicates % by weight based on a film agent composition which is obtained by removing a solvent (e.g., water, lower alcohols such as methanol, ethanol and the like) from a film agent solution.

[0835] The sustained release preparation is produced by preparing a nucleus containing a drugs as exemplified below, then, coating the resulted nucleus with a film agent solution prepared by heat-solving a water-insoluble substance, swellable polymer and the like or by dissolving or dispersing it in a solvent.

I. Preparation of Nucleus Containing Drug

[0836] The form of nucleus containing a drug to be coated with a film agent (hereinafter, sometimes simply referred to as nucleus) is not particularly restricted, and preferably, the nucleus is formed into particles such as a granule or fine particle.

[0837] When the nucleus is composed of granules or fine particles, the average particle size thereof is preferably from about 150 to about 2000 µm, further preferably, from about 500 to about 1400 µm.

[0838] Preparation of the Nucleus can be Effected by a Usual production method. For example, a suitable excipient, binding agent, disintegrating agent, lubricant, stabilizer and the like are mixed with a drug, and the mixture is subjected to a wet extrusion granulating method, fluidized bed granulating method or the like, to prepare a nucleus.

[0839] The content of drugs in a nucleus is from about 0.5 to about 95% (w/w), preferably from about 5.0 to about 80% (w/w), further preferably from about 30 to about 70% (w/w).

[0840] As the excipient contained in the nucleus, for example, saccharides such as sucrose, lactose, mannitol, glucose and the like, starch, crystalline cellulose, calcium phosphate, corn starch and the like are used. Among them, crystalline cellulose, corn starch are preferable.

[0841] As the binding agent, for example, polyvinyl alcohol, hydroxypropylcellulose, polyethylene glycol, polyvinyl pyrrolidone, Pluronic F68, gum Arabic, gelatin, starch and the like are used. As the disintegrating agent, for example, carboxymethylcellulose calcium (ECG505), croscarmellose sodium (Ac-Di-Sol), crosslinked polyvinylpyrrolidone (Crosppovidone), low substituted hydroxypropylcellulose (L-HPC) and the like are used. Among them, hydroxypropylcellulose, polyvinylpyrrolidone, lower substituted hydroxypropylcellulose are preferable. As the lubricant and coagulation inhibitor, for example, talc, magnesium stearate and inorganic salts thereof are used, and as the lubricant, polyethylene glycol and the like are used. As the stabilizer, acids such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic acid and the like, are used.

[0842] A nucleus can also be prepared by, in addition to the above-mentioned productions method, for example, a rolling granulation method in which a drug or a mixture of a drug with an excipient, lubricant and the like is added portionwise

onto an inert carrier particle which is the core of the nucleus while spraying a binder dissolved in a suitable solvent such as water, lower alcohol (e.g., methanol, ethanol and the like) and the like, a pan coating method, a fluidized bed coating method or a melt granulating method. As the inert carrier particle, for example, those made of sucrose, lactose, starch, crystalline cellulose or waxes can be used, and the average particle size thereof is preferably from about 100 µm to about 1500 µm.

[0843] For separating a drug contained in a nucleus and a film agent, the surface of the nucleus may be coated with a protective agent. As the protective agent, for example, the above-mentioned hydrophilic substances, water-insoluble substances and the like are used. As the protective agent, preferably polyethylene glycol, and polysaccharides having a hydroxyalkyl or carboxyalkyl are used, more preferably, hydroxypropylmethylcellulose and hydroxypropylcellulose are used. The protective agent may contain, as stabilizer, acids such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic acid and the like, and lubricants such as talc and the like. When the protective agent is used, the coating amount is from about 1 to about 15% (w/w), preferably from about 1 to about 10% (w/w), further preferably from about 2 to about 8% (w/w), based on the nucleus.

[0844] The protective agent can be coated by a usual coating method, and specifically, the protective agent can be coated by spray-coating the nucleus, for example, by a fluidized bed coating method, pan coating method and the like.

II. Coating of Nucleus with Film Agent

[0845] A nucleus obtained in the above-mentioned step I is coated with a film agent solution obtained by heat-solving the above-mentioned water-insoluble substance and pH-dependent swellable polymer, and a hydrophilic substance, or by dissolving or dispersing them in a solvent, to give a sustained release preparation.

[0846] As the method for coating a nucleus with a film agent solution, for example, a spray coating method and the like are listed.

[0847] The composition ratio of a water-insoluble substance, swellable polymer or hydrophilic substance in a film agent solution is appropriately selected so that the contents of these components in a coated film are the above-mentioned contents, respectively.

[0848] The coating amount of a film agent is from about 1 to about 90% (w/w), preferably from about 5 to about 50% (w/w), further preferably from about 5 to about 35% (w/w), based on a nucleus (not including coating amount of protective agent).

[0849] As the solvent in a film agent solution, water or an organic solvent can be used alone or in admixture thereof. In the case of use in admixture, the mixing ratio of water to an organic solvent (water/organic solvent: by weight) can be varied in the range from 1 to 100%, and preferably from 1 to about 30%. The organic solvent is not particularly restricted providing it dissolves a water-insoluble substance, and for example, lower alcohols such as methyl alcohol, ethyl alcohol, isopropyl alcohol, n-butyl alcohol and the like, lower alkanone such as acetone and the like, acetonitrile, chloroform, methylene chloride and the like are used. Among them, lower alcohols are preferable, and ethyl alcohol and isopropyl alcohol are particularly preferable. Water, and a mixture of water with an organic solvent are preferably used as a solvent for a film agent. In this case, if necessary, an acid such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic

acid and the like may also be added into a film agent solution for stabilizing the film agent solution.

[0850] An operation of coating by spray coating can be effected by a usual coating method, and specifically, it can be effected by coating a film agent solution onto a nucleus by a fluidized bed coating method, pan coating method and the like. In this case, if necessary, talc, titanium oxide, magnesium stearate, calcium stearate, light anhydrous silicic acid and the like may also be added as a lubricant, and glycerin fatty acid ester, hydrogenated castor oil, triethyl citrate, cetyl alcohol, stearyl alcohol and the like may also be added as a plasticizer.

[0851] After coating with a film agent, if necessary, an antistatic agent such as talc and the like may be mixed.

[0852] The immediate-release preparation may be liquid (solution, suspension, emulsion and the like) or solid (particle, pill, tablet and the like). As the immediate-release preparation, oral administration agents and parenteral administration agents such as an injection and the like are used, and oral administration agents are preferable.

[0853] The immediate-release preparation, usually, may contain, in addition to an active component drug, also carriers, additives and excipients conventionally used in the pharmaceutical field (hereinafter, sometimes abbreviated as excipient). The excipient used is not particularly restricted providing it is an excipient ordinarily used as a preparation excipient. For example, as the excipient for an oral solid preparation, lactose, starch, corn starch, crystalline cellulose (Avicel PH101, manufactured by Asahi Kasei Corporation, and the like), powder sugar, granulated sugar, mannitol, light anhydrous silicic acid, magnesium carbonate, calcium carbonate, L-cysteine and the like are listed, and preferably, corn starch and mannitol and the like are listed. These excipients can be used alone or in combination of two or more. The content of the excipient is, for example, from about 4.5 to about 99.4 w/w %, preferably from about 20 to about 98.5 w/w %, further preferably from about 30 to about 97 w/w %, based on the total amount of the immediate-release preparation.

[0854] The content of a drug in the immediate-release preparation can be appropriately selected in the range from about 0.5 to about 95 w/w %, preferably from about 1 to about 60 w/w % based on the total amount of the immediate-release preparation.

[0855] When the immediate-release preparation is an oral solid preparation, it usually contains, in addition to the above-mentioned components, also an integrating agent. As this integrating agent, for example, carboxymethylcellulose calcium (ECG-505, manufactured by Gotoku Yakuhin), croscarmelose sodium (e.g., Actisol, manufactured by Asahi Kasei Corporation), crospovidone (e.g., Kollidon CL, manufactured by BASF), low substituted hydroxypropylcellulose (manufactured by Shin-Etsu Chemical Co., Ltd.), carboxymethylstarch (manufactured by Matsutani Kagaku K.K.), carboxymethylstarch sodium (Exprotab, manufactured by Kimura Sangyo), partially pregelatinized starch (PCS, manufactured by Asahi Kasei Corporation), and the like are used, and for example, those which disintegrate a granule by absorbing water in contact with water, causing swelling, or making a channel between an effective ingredient and an excipient constituting the nucleus, can be used. These disintegrating agents can be used alone or in combination of two or more. The amount of the disintegrating agent used is appropriately selected depending on the kind and blending amount

of a drug used, design of releasing property, and the like, and for example, from about 0.05 to about 30 w/w %, preferably from about 0.5 to about 15 w/w %, based on the total amount of the immediate-release preparation.

[0856] When the immediate-release preparation is an oral solid preparation, it may further contain, in addition to the above-mentioned composition, if desired, additives conventional in solid preparations. As such an additive, there are used, for example, a binder (e.g., sucrose, gelatin, gum Arabic powder, methylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose, carboxymethylcellulose, polyvinylpyrrolidone, pullulan, dextrin and the like), a lubricant (e.g., polyethylene glycol, magnesium stearate, talc, light anhydrous silicic acid (e.g., Aerosil (manufactured by Nippon Aerosil))), a surfactant (e.g., anionic surfactants such as sodium alkylsulfate and the like, nonionic surfactants such as polyoxyethylene fatty acid ester and polyoxyethylene sorbitan fatty acid ester, polyoxyethylene castor oil derivatives and the like), a colorant (e.g., tar coloring matter, caramel, iron oxide red, titanium oxide, riboflavins), if necessary, an appetizing agent (e.g., sweetening agent, flavoring agent and the like), an adsorbent, preservative, wetting agent, antistatic agent, and the like. Further, as the stabilizer, an organic acid such as tartaric acid, citric acid, succinic acid, fumaric acid and the like may also be added.

[0857] As the above-mentioned binder, hydroxypropylcellulose, polyethylene glycol and polyvinylpyrrolidone and the like are preferably used.

[0858] The immediate-release preparation can be prepared by, based on a usual technology of producing preparations, mixing the above-mentioned components, and if necessary, further kneading the mixture, and molding it. The above-mentioned mixing is conducted by generally used methods, for example, mixing, kneading and the like. Specifically, when a immediate-release preparation is formed, for example, into a particle, it can be prepared, according to the same means as in the above-mentioned method for preparing a nucleus of a sustained release preparation, by mixing the components using a vertical granulator, universal kneader (manufactured by Hata Tekkosho), fluidized bed granulator FD-5S (manufactured by Powrex Corporation), and the like, and then, granulating the mixture by a wet extrusion granulation method, fluidized bed granulation method and the like.

[0859] Thus obtained immediate-release preparation and sustained release preparation may be themselves made into products or made into products appropriately together with preparation excipients and the like, separately, by an ordinary method, then, may be administered simultaneously or may be administered in combination at any administration interval, or they may be themselves made into one preparation for oral administration (e.g., granule, fine particle, tablet, capsule and the like) or made into one preparation for oral administration appropriately together with preparation excipients and the like. It may also be permissible that they are made into granules or fine particles, and filled in the same capsule to be used as a preparation for oral administration.

[3] Sublingual, Buccal or Intraoral Quick Disintegrating Agent and Preparation Thereof.

[0860] Sublingual, buccal or intraoral quick disintegrating agents may be a solid preparation such as tablet and the like, or may be an oral mucosa membrane patch (film).

present invention or the concomitant drug and an excipient is preferable. It may contain also auxiliary agents such as a lubricant, isotonizing agent, hydrophilic carrier, water-dispersible polymer, stabilizer and the like. Further, if desired, the above-mentioned auxiliary agents such as a lubricant, isotonizing agent, hydrophilic carrier, water-dispersible polymer, stabilizer, colorant, sweetening agent, preservative and the like may be mixed. The sublingual, buccal or intraoral quick disintegrating agent is obtained by mixing the above-mentioned components simultaneously or at a time interval, then subjecting the mixture to tablet-making molding under pressure. For obtaining suitable hardness, it may also be permissible that the materials are moistened by using a solvent such as water, alcohol and the like if desired before and after the tablet making process, and after the molding, the materials are dried, to obtain a product.

[0864] In the case of molding into a mucosa membrane patch (film), the compound of the present invention or the concomitant drug and the above-mentioned water-dispersible polymer (preferably, hydroxypropylcellulose, hydroxypropylmethylcellulose), excipient and the like are dissolved in a solvent such as water and the like, and the resulted solution is cast to give a film. Further, additives such as a plasticizer, stabilizer, antioxidant, preservative, colorant, buffer, sweetening agent and the like may also be added. For imparting suitable elasticity to the film, glycols such as polyethylene glycol, propylene glycol and the like may be contained, or for

enhancing adhesion of the film to an intraoral mucosa membrane lining, a bio-adhesive polymer (e.g., polycarbophil, carbopol) may also be contained. In the casting, a solution is poured on the non-adhesive surface, spread to uniform thickness (preferably, about 10 to 1000 micron) by an application tool such as a doctor blade and the like, then, the solution is dried to form a film. It may be advantageous that thus formed film is dried at room temperature or under heat, and cut into a desired area.

Experimental Example

[3433] Genetic operation methods described in Experimental Examples below are based on the methods described in a book (Maniatis et al., Molecular Cloning, Cold Spring Harbor Laboratory, 1989), and the appended protocol of the reagent. Experimental Example 1. Construction of Gli reporter plasmid

[3434] Gli reporter plasmid was constructed by inserting 8×Gli-binding site and chicken δ -crystallin promoter into the upstream of luc+ of pGL3 (Promega).

[3435] δ -Crystallin promoter was cloned by PCR method using, as a primer set, synthetic DNAs

5' -GAAGATCTGCCAGCCCCAGGGCTCCGGGGC-3' (SEQ ID NO: 1)

5' -CCCAAGCTTCTGCCCGCACAGCCCTGCTC-3' (SEQ ID NO: 2)

prepared in reference to the base sequence described in GenBank accession No.; X02187, and chicken genome DNA (Clontech) as a template. PCR reaction was performed using Pfu Turbo (Stratagene) and following the attached protocol. The obtained 108 bp fragment was digested with restriction

enzymes BglII and HindIII, and inserted into BglII-HindIII site of pGL3 to give plasmid pGL3/δ-cry promoter.

[3436] As 8xGli-binding site, a sequence containing eight 9-bp Gli bound consensus sequences (GACCACCCA) described in Yoon et al., J. Biol. Chem., vol. 273, pages 3496-3501 (1998) was prepared from synthetic DNA. That is, two synthetic DNAs,

(SEQ ID NO: 3)
5'-GGGGTACCGACCACCCAGACCACCCAGACCACCCAGACCACCCAG
ACCACCCAGACCACCCAGACCACCCAGACCACCCAGATCTTC-3'

(SEQ ID NO: 4)
5'-GAAGATCTGGGTGGTCTGGGTGGTCTGGGTGGTCTGGGTGGTCT
GGGTGGTGTGGGTCTGGGTGGTCTGGGTGGTGGTACCCCC-3'

were heat treated at 95° C. for 2 minutes, and incubated at 37° C. for 1 hr for annealing to give a double stranded DNA of the above-mentioned two synthetic DNAs. The obtained double stranded DNA was digested with restriction enzymes BglII and KpnI, and the obtained DNA fragment was inserted into BglIII-KpnI site of pGL3/δ-cry promoter to construct plasmid pGL3/δ-cry promoter, 8xGli binding site, i.e., Gli reporter plasmid.

Experimental Example 2

Construction of Plasmid for Expression of Mouse Shh-N End Fragment

[3437] As a material for construction of plasmid for Shh-N end fragment expression, mouse Shh cDNA was cloned at first.

[3438] The mouse Shh cDNA was cloned by Nested PCR method using mouse 11-day fetus cDNA (Clontech) as a template. The primer sequence was prepared in reference to the base sequence described in GenBank accession No.; NM_009170.

[3439] As the primer set for 1st PCR,

5'-CTGGGTGGGGATCGGAGACA-3' (SEQ ID NO: 5)

5'-GCGCTTCCCATCAGTTCTTATT-3' (SEQ ID NO: 6)

were used, and as the primer set for 2nd PCR,

5'-GGGGTACCATGCTGCTGCTGGCCA-3' (SEQ ID NO: 7)

5'-GCTCTAGATCAGCTGGACTTGACCGCCA-3' (SEQ ID NO: 8)

were used. PCR reaction was performed using Pfu Turbo (Stratagene) and following the attached protocol. The resulting PCR product was cloned by pcDNA3.1 (+) (Invitrogen), and the inserted base sequence was confirmed.

[3440] Using the mouse Shh cDNA sequence obtained as mentioned above as a template, a partial cDNA sequence wherein stop codon (TGA) was added to 3'-terminal of cDNA sequence encoding 1st to 198th amino acid sequence of mouse Shh was obtained by PCR method. As the primer set,

5'-ATGCTGCTGCTGCCAG-3' (SEQ ID NO: 9)

5'-TCAGCCGCCGGATTTGCCG-3' (SEQ ID NO: 10)

were used.

[3441] PCR reaction was performed using Pfu Turbo (Stratagene) and following the attached protocol. The obtained PCR product was cloned by pcDNA3.1 (+) (Invitrogen), and the inserted base sequence was confirmed.

Experimental Example 6

In Vivo Anti-Tumor Test

[3449] According to the description in Sasaki, K. et al., (2006) Cancer Res. 66: 4215-4222, an anti-tumor effect of a

compound was evaluated using a mouse medulloblastoma allogeneic transplantation model. To be precise, Patched 1 gene mutant mouse (lineage name: Ptch1tm1Mps/J) was purchased from The Jackson Laboratory and p53 gene mutant mouse (lineage name: P53N4-M, Nomenclature: B6.129-Trp53tm1BrdN4) was purchased from Taconic, and a mouse of Patched 1(+/-), p53(-/-) phenotype was prepared by mating. The tumor tissue of medulloblastoma spontaneously occurred in the cerebellum of 7- to 9-week-old Patched 1(+/-), p53(-/-) mouse was taken and subcutaneously transplanted into a nude mouse (lineage name: CAnN.Cg-Foxn1<nu>/CrlCrlj).

[3450] An anti-tumor test was performed using a tumor passaged by subcutaneous transplantation. A tumor mass was isolated by a 40 μm cell strainer (BD Biosciences, Cat. No. 352340), a tumor suspension was prepared with Leibovitz's L-15 medium (GIBCO, Cat. No. 11415-114) in a 2-fold amount relative to the tumor mass weight, mixed with an equivalent amount of matrigel (BD Biosciences, Cat. No. 356237), and subcutaneously transplanted to a mouse at 1001 per transplantation site. The tumor diameter after transplantation was measured and, when the tumor size reached 150-250 mm³, the anti-tumor test was started using 5 mice per group.

[3451] The test compound was prepared to achieve a dose of 6.25 mg/kg with a 0.5% methylcellulose (Shin-Etsu Chemical Co., Ltd., Cat. No. SM-100) suspension, and orally administered twice a day for 2 weeks. The tumor size was calculated based on the longer diameter and shorter diameter of the tumor measured with an electron vernier caliper. After the start of the test, the tumor size was measured every 2 or 3 days and the growth rate of the tumor size was calculated. A tumor growth inhibitory effect of 95% or above was confirmed in each test compound administration group. The growth rate of the tumor size by each test compound at the end of the test is shown in the following Table.

[3452] The tumor growth rate and the results of a significant difference test by the administration of each test compound are shown in the Table. The growth rate of the tumor size (T/C) was calculated according to:

$$\text{growth rate (T/C)} = ((\text{tumor size of compound administration group at the end of administration}) - (\text{tumor size of compound administration group at the start of administration})) / ((\text{tumor size of control group at the end of administration}) - (\text{tumor size of control group at the start of administration})) \times 100.$$

TABLE 4

Example	T/C (%)	P value (Dunnett's test)
79-1)	0.8	≤0.001
124-1)	2.0	≤0.001
139-1)	0.4	≤0.001
140-1)	5.3	≤0.001
143-1)	0.0	≤0.001

[3453] The above-mentioned results confirm that the compound of the present invention shows an anti-tumor effect.

INDUSTRIALLY APPLICABILITY

[3454] Since the compound of the present invention shows a superior Smo inhibitory action, a clinically useful agent for the prophylaxis or treatment of diseases related to Smo (e.g., cancer etc.) can be provided. In addition, since the compound of the present invention is also superior in the efficacy expres-

sion, pharmacokinetics, solubility, interaction with other pharmaceutical products, safety and stability, it is useful as a pharmaceutical agent.

[3455] This application is based on application Nos. 2008-045134 and 2008-256755 filed in Japan, the contents of which are incorporated hereinto by reference.
