DESCRIPTION
FUSED HETEROCYCLIC COMPOUND
Technical Field

【0001】

5 The present invention relates to a fused pyrimidine compound having a growth factor receptor tyrosine kinase inhibitory activity, which is useful for the prophylaxis or treatment of cancer, a production method thereof and use thereof.

10 **Background of the Invention**

【0002】

The gene of cell growth factor and growth factor receptor is called a protooncogene and plays a key role in the pathology of human tumor. The epithelial cell growth factor 15 receptor family (erbB) includes EGFR, HER2, HER3 and HER4, which are type I receptor type tyrosine kinases. These erbB family express in various cell groups, and are deeply involved in the control of the growth and differentiation of cells and the control of suppression of cell death (apoptosis 20 suppression). For example, high expression of EGFR and HER2, and homeostatic activation of receptors are empirically known to transform cells.

【0003】

It is also known that high expression and simultaneous 25 expression of each of these receptors are poor prognostic factors in various cancer patients.

【0004】

These receptors are bound with many peptide ligands such as EGF, TGF α and the like, and binding of the ligand promotes 30 homo- or heterodimerization of the receptors. This induces increase of kinase activity from self-phosphorylation or transphosphorylation of the receptors, and causes activation of downstream signaling pathway (MAPK, Akt) via a protein bound with a particular phosphorylated tyrosine residue. This 35 is the mechanism of the receptor activity of the above-

mentioned cell growth, differentiation, cell death suppression and the like, which is considered to be responsible for the high expression of receptor in cancer and malignant degeneration of cancer due to topical increase in the ligand 5 concentration.

【0005】

Many cancers are associated with the high expression of EGFR or HER2. For example, breast cancer (20-30%), ovarian cancer (20-40%), non-small cell lung cancer (30-60%), 10 colorectal cancer (40-80%), prostate cancer (10-60%), urinary bladder cancer (30-60%), kidney cancer (20-40%) and the like can be mentioned. Moreover, receptor expression and prognosis are correlated, and receptor expression is a poor prognostic factor in breast cancer, non-small cell lung cancer and the 15 like.

【0006】

In recent years, clinical use of a humanized anti-HER2 antibody (Trastuzumab) against HER2 highly expressing breast cancer, clinical trial of anti-EGFR antibody and clinical 20 trials of several low molecular weight receptor enzyme inhibitors have demonstrated a potential of these drugs against HER2 or EGFR for therapeutic drugs for cancer. While these drugs show a tumor growth inhibitory action in clinical and non-clinical trials, they are known to induce inhibition 25 of receptor enzyme activity and suppression of downstream signaling pathway. Therefore, a compound inhibiting EGFR or HER2 kinase, or inhibiting activation of EGFR or HER2 kinase is effective as a therapeutic drug for cancer.

【0007】

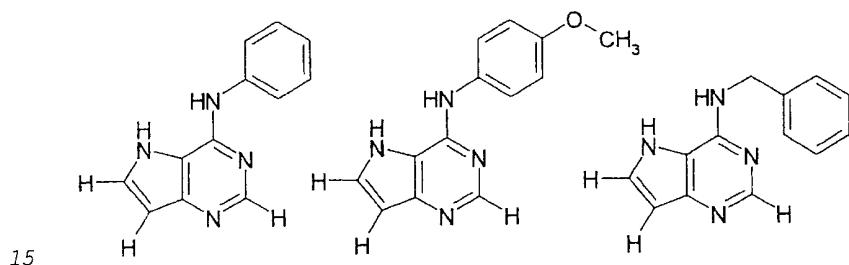

As a compound that inhibits receptor type tyrosine 30 kinases represented by HER2/EGFR kinase, fused heterocyclic compounds (e.g., patent reference 1 (WO97/13771), patent reference 2 (WO98/02437), and patent reference 3 (WO00/44728)), quinazoline derivatives (e.g., patent reference 4 (WO02/02552), 35 patent reference 5 (WO01/98277), patent reference 6

[0008]

As to pyrrolo[3,2-d]pyrimidine derivatives, the following 10 compounds are known as compounds having a cell growth inhibitory activity (non-patent reference 1 (Khim.-Farm. Zh., 1982, 16, 1338-1343); non-patent reference 2 (Collect. Czech. Chem. Commun., 2003, 68, 779-791)).

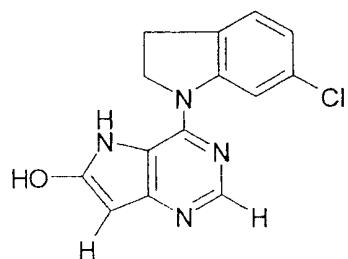

[0009]

[0010]

As a compound having a receptor type tyrosine kinase inhibitory activity, the following pyrrolo[3,2-d]pyrimidine derivative is known (patent reference 13 (W096/40142) and 20 patent reference (W098/23613)).

[0011]

[0012]

Furthermore, as to pyrazolo[4,3-d]pyrimidine derivatives, 25 3,5,7-trisubstituted pyrazolo[4,3-d]pyrimidine derivatives are

known as compounds having a CDK inhibitory action, a cell growth inhibitory action and/or an apoptosis inducing action (e.g., patent reference 15 (EP-A-1348707)), and 3-isopropylpyrazolo[4,3-d]pyrimidine derivatives are known as 5 compounds having a CDK1/cyclin B inhibitory activity (e.g., non-patent reference 3 (Bioorganic & Medicinal Chemistry Letters, 2003, 13, 2989-2992)). [0146]

wherein each symbol is as defined above.

【0147】

The aforementioned reaction can be carried out under cooling, preferably about not more than -20°C, and the reaction time is 20 generally about 15 min to 50 hr, preferably about 30 min to 4 hr.

【0148】

Thus-obtained compound (I) can be isolated and purified by a separation means known *per se*, such as concentration, 25 concentration under reduced pressure, solvent extraction, crystallization, recrystallization, phase transfer, chromatography and the like.

Furthermore, using BAC-TO-BAC Baculovirus Expression System (Invitrogen), recombinant baculovirus BAC-HER2 was prepared.

Then, a kinase reaction buffer (20 µL) containing 125 µM ATP and 45 µCi/mL [γ -³²P]ATP was added, and the kinase reaction was initiated with 50 µL of the final reaction mixture. A kinase reaction was performed at room 25 temperature for 10 min, and the kinase reaction was quenched by addition of 20% TCA solution (50 µL). The mixture after completion of the reaction was stood at room temperature for 30 min, and acid insoluble fractions in the mixture after completion of the reaction were collected in a 96 well GF/C filter plate (PerkinElmer) using a cell harvester 30 (PerkinElmer). Thereafter, the filter containing the acid insoluble fractions was washed with 3% phosphoric acid solution. After washing, the filter plate was dried at 45°C for 60 min, and 25 µL of MicroScinti 0 (PerkinElmer) was added. 35 The radioactivity was measured using TopCount (PerkinElmer).

HER2 kinase inhibitory rate (%) of the test compound was calculated by the following formula:

Inhibitory rate (%) = (1 - (count of test compound - blank) / (control - blank)) × 100

The count of the solution reacted without addition of the compound was used as a "control", and the count of the solution without the compound and HER2 intracellular domain was used as a "blank". The results of the inhibitory rate of the compounds are shown in Table 1.

From the foregoing, it was shown that the compounds of the present invention strongly inhibited the activity of HER2 kinase.

Experimental Example 2A Cloning of human EGFR gene and preparation of recombinant baculovirus

Human EGFR gene was cloned by RT-PCR using total RNA prepared from A431 cells as a template. The primer used for RT-PCR was prepared in consideration of the information of nucleotide sequence (Genbank Accession No. X00588) of EGFR gene by adding a nucleotide sequence encoding DYKDDDD peptide and a restriction enzyme recognition sequence to a nucleotide

sequence (corresponding to 2191-3819 of Genbank Accession No. X00588 as a base, 669-1210 amino acids of Genbank Accession No. NP_005219 as a protein) encoding the EGFR intracellular domain region such that the protein contains an N-terminal DYKDDDD peptide tag. The primer nucleotide sequence is shown below.

and

10 EGFR-L:5'-AATTAAGCATGCTCATGCTCCAATAATTCACTGCTTGTGG-3' (SEQ ID NO: 4)

The RT reaction was conducted using SuperScript First-Strand Synthesis System for RT-PCR (Invitrogen) and the PCR reaction was conducted using a KOD-plus kit (TOYOBO). The 15 obtained PCR product was electrophoresed on agarose gel (1%), the DNA fragment amplified by PCR was recovered from the gel, and then digested with restriction enzymes Sal I and Sph I. The DNA treated with the restriction enzymes was electrophoresed on agarose gel (1%), and the obtained DNA 20 fragment was recovered and ligated to plasmid pFASTBAC1 (Invitrogen) digested with restriction enzymes Sal I and Sph I to give expression plasmid pFB-EGFR. The nucleotide sequence of the insertion fragment was confirmed and found to be identical with the nucleotide sequence (2191-3819 of Genbank 25 Accession X00588) of EGFR intracellular domain. Furthermore, using BAC-TO-BAC Baculovirus Expression System (Invitrogen), recombinant baculovirus BAC-EGFR was prepared.

Experimental Example 2B Preparation of human EGFR
30 intracellular domain protein

SF-21 cells were sown at 1×10^6 cells/mL in Sf-900II SFM medium (1 L, Invitrogen) containing 10% fetal bovine serum (trace), 50 mg/L gentamicin (Invitrogen) and 0.1% Pluronic F-68 (Invitrogen), and shaking culture was performed using a 2 L 35 volume Erlenmeyer flask at 27°C, 100 rpm. After culturing for

" 24 hrs, recombinant baculovirus BAC-EGFR (13.4 mL) was added, and the mixture was further cultured for 3 days. The culture medium was centrifuged at 2,000 rpm for 5 min to give virus-infected cells. The infected cells were washed with a
5 phosphate buffered saline (Invitrogen), centrifuged under the same conditions, and the cells were preserved at -80°C. The cryopreserved cells were thawed in ice, suspended in buffer A (50 mM Tris buffer (30 mL, pH 7.4) containing 20% glycerol, 0.15 M NaCl) supplemented with Complete Protease Inhibitor
10 (Boehringer), and ruptured 3 times with a Polytron homogenizer (Kinematica) at 20,000 rpm for 30 sec. The ruptured solution was clarified by centrifugation at 40,000 rpm for 30 min, and filtered with a 0.45 µm filter. The filtrate was passed through a column packed with Anti-FLAG M2 Affinity Gel (4 mL, Sigma-Aldrich) at a flow rate of about 0.5 mL/min. The column
15 was washed with buffer A, and eluted with buffer A containing 100 µg/mL of FLAG peptide. The eluent was concentrated with Vivaspin 20 (Vivascience) having a molecular weight cut off of 30K. The concentrate was purified by gel filtration using Hi
20 Load 16/60 Superdex 200 pg (GE Healthcare Bioscience) equilibrated with buffer A. The fractions containing EGFR intracellular domain were collected and cryopreserved at -80°C.

Experimental Example 2C Determination of EGFR kinase
25 inhibitory activity

EGFR kinase reaction was performed using a 96 well plate. As a buffer for kinase reaction, a buffer having a composition of 50 mM Tris-HCl (pH 7.5), 5 mM MnCl₂, 2 mM dithiothreitol, 0.01% Tween-20 was used. The compound of the present invention
30 was dissolved in dimethyl sulfoxide (DMSO), and diluted with the kinase reaction buffer so that DMSO concentration would be 0.1% during kinase reaction. This compound solution (10 µL) was mixed with a kinase reaction buffer (20 µL) containing EGFR intracellular domain (0.625 µg/mL) obtained in Experimental
35 Example 2B and polypeptide substrate poly-Glu:Tyr (4:1) (Sigma

Ltd., 12.5 µg/mL), and the mixture was stood at room temperature for 5 min. Then, a kinase reaction buffer (20 µL) containing 125 µM ATP and 45 µCi/mL [γ -³²P]ATP was added, and the kinase reaction was initiated with 50 µL of the final reaction mixture. A kinase reaction was performed at room temperature for 10 min, and the kinase reaction was quenched by addition of 20% TCA solution (50 µL). The mixture after completion of the reaction was stood at room temperature for 30 min, and acid insoluble fractions in the mixture after completion of the reaction were collected in a 96 well GF/C filter plate (PerkinElmer) using a cell harvester (PerkinElmer). Thereafter, the filter containing the acid insoluble fractions was washed with 3% phosphoric acid solution. After washing, the filter plate was dried at 45°C for 60 min, and 25 µL of MicroScinti 0 (PerkinElmer) was added. The radioactivity was measured using TopCount (PerkinElmer). EGFR kinase inhibitory rate (%) of the test compound was calculated by the following formula:

$$\text{Inhibitory rate (\%)} = \frac{(1 - (\text{count of test compound} - \text{blank}))}{(\text{control} - \text{blank})} \times 100$$

The count of the solution reacted without addition of the compound was used as a "control", and the count of the solution without the compound and EGFR intracellular domain was used as a "blank". The results of the inhibitory rate of the compounds are shown in Table 2.

From the foregoing, it was shown that the compounds of the present invention strongly inhibited the activity of EGFR kinase.

Experimental Example 3 Inhibitory action on breast cancer cell BT-474 proliferation in vitro

A suspension of human breast cancer cell BT-474 (100 µl (6,000 cells)) were plated in a 96-well microplate and 10 cultured in an incubator (37°C, 5% carbon dioxide). On the following day, 100 µl of a solution of each test compound previously diluted serially in 2-fold, was added, and the cells were cultured for 5 days. After the culture medium containing the test compound was removed, the cells were 15 washed and fixed with 50% trichloroacetic acid, after which a 0.4% (w/v) SRB dye solution (dissolved in 1% acetic acid) was added to stain as well as fix the cell protein (Skehan et al., Journal of the National Cancer Institute, Vol. 82, pp. 1107-1112, 1990). After washing with a 1% acetic acid solution, 100 20 µl of extract solution (10 mM, Tris buffer) was added to extract the dye and the absorbance was measured at a wavelength of 550 nm to quantify the amount of cells as protein content. Taking as 100% the protein content for the control group, which received no test compound solution, the 25 ratio of the residual protein content for each treatment group was determined, and the compound concentration required to achieve 50% suppression of the residual cell content relative to the control (IC_{50} value) was calculated. The results are shown in Table 3.
